Introduction

The Trustee of the Roche Pension Fund – Defined Benefit (“DB”) & Defined Contribution (“DC”) Sections (“the Fund”) recognises that climate change is one of the most important issues of our time, which will impact all countries, companies and individuals. The Trustee recognises climate change as a significant financial risk that could impact the financial security of members’ benefits if it is not properly measured and mitigated. As well as providing risks to the Fund, the transition to a lower carbon economy and the mitigation of, and adaptation to, the physical risks of climate change may create new investment opportunities if managed appropriately.

This is the Trustee’s fourth report, which has been prepared in line with the statutory requirements prescribed by the Department for Work and Pensions¹.

The report covers the 12-month period to 31 March 2026 and details how the Trustee is addressing climate change including progress made since the first report was published in 2023.

The Trustee supports the recommendations of Financial Stability Board’s Task Force on Climate-related Financial Disclosures (“TCFD”) as a framework to help manage and report on the actions being taken to identify climate-related financial risks and opportunities in the Fund².

The report explains how the Trustee has established and maintained oversight and processes to satisfy themselves that the Fund’s relevant climate-related risks and opportunities are considered appropriately by all stakeholders involved in the day-to-day management of the Fund. The sub-headings in this report address the specific disclosure requirements in the statutory guidance and which are based on the recommendations of the TCFD.

This report discloses a range of climate-related information pertaining to the Fund with the intent of improving transparency toward members, the Pensions Regulator and the pension sector generally, and to ensure that the Trustee is thorough and rigorous in identifying, assessing and managing climate risk.

The Trustee recognises that climate issues can be more relevant and readily implementable for some parts of the investment strategy than others. This statement outlines where governance of climate risk and opportunities has been applied, focusing on (but not limited to):

- (i) For the DB Section – The Asset Allocation as of 31 December 2025.
- (ii) For the DC Section – The Default Investment Option, the Roche Flexible Retirement Lifestyle Strategy.

Regarding the DB Section, we will seek to expand the remit of this reporting to cover the entirety of the portfolio as and when the ability to monitor these risks becomes more achievable via improved availability of data (noting the DB Section has significant private market holdings with low current data availability).

¹ The Occupational Pension Schemes (Climate Change Governance and Reporting) Regulations 2021 and the Occupational Pension Schemes (Climate Change Governance and Reporting) (Miscellaneous Provisions and Amendments) Regulations 2021.

² TCFD has been disbanded on 12 October 2023. Its recommendations remain relevant and have been incorporated into frameworks such as the International Sustainability Standards Board (ISSB) standards IFRS S1 and IFRS S2.

Executive Summary

This report covers the following four areas, consistent with the framework recommended by the TCFD:

- **Governance:** How the Trustee maintains oversight and incorporates climate change into its decision making;
- **Strategy:** How potential future climate warming scenarios could impact the Fund;
- **Risk Management:** How the Trustee incorporates climate-related risk in its risk management processes; and
- **Metrics and Targets:** How the Trustee measures and monitors progress against different climate-related indicators known as metrics and targets.

The key messages from this report are:

Both Sections

- Climate change risk can have an impact on the long-term outcomes for the Fund (for both DB and DC members).
- The Trustee has processes in place to identify, assess and mitigate climate change risk.

DB Section

- The Trustee made changes to its long-term investment objective to achieve a funding position of 105% on a gilts +0.5% p.a. basis (“low-risk basis”) by the period 31 March 2030 to 31 March 2034.
- The Trustee re-risked the Fund during the year and increased the target growth allocation from 20.6% to 36% to target an overall portfolio return of gilts +1.8% p.a. (net of fees).
- The changes to the investment strategy have meant the portfolio of assets assessed has changed materially over the year and should be considered when comparing the metric data to prior years.
- Whilst the metrics monitored by the Trustees have not improved over the year due to the changes in investment strategy, the Fund still remains on target of reducing carbon emissions intensity against the baseline, capturing the scope 1 and 2 emissions on the non-sovereign assets.

DC Section

- Three emissions-based metrics monitor DC Section climate exposure; all have improved since baseline.
- Portfolio alignment-based metrics (implied temperature rise and SBTi target %) and one non-emissions-based metric (Data Quality) are tracked.
- A target to reduce the level of carbon emissions of the Default Investment Option was set in 2022, progress monitored annually, and actions determined. The level of emission has decreased by c. 67% since the baseline year.

Recent developments

In March 2025, the Trustee undertook an Environmental, Social and Corporate Governance (“ESG”) Beliefs Survey to identify gaps in their understanding and to ensure that their policies and wider strategy is aligned with their current beliefs. The Trustee discussed its findings in June 2025; it was determined that the Trustee generally has a well-developed understanding of ESG issues but noted ongoing training should be undertaken to ensure the Trustee keeps abreast of future developments in climate change and sustainable investment. The Trustee has also undertaken an annual review of their ESG Policy Document which sets out the Trustee’s key ESG principles that have been established and the approach to considering climate risk and other ESG factors.

Climate Scenario Analysis

The Trustee last undertook quantitative climate scenario analysis to test the resilience of the DB and DC Sections' investment strategies as at 31 March 2024. For the DC Section, there has been no update to this analysis in 2025, as there has been no material change to the investment strategy over the year. With regards to the DB Section, given the changes to the investment strategy, an update to the climate scenario analysis was undertaken and is presented in Appendix A.

Conclusions and next steps

The Trustee recognises that further progress needs to be made to consider climate-related risks and opportunities in a balanced and proportionate manner. The ultimate responsibility of the Trustee in regard to the DB Section is to pay members their benefits. For the DC Section the ultimate responsibility of the Trustee is to maximise DC member outcomes at retirement. The Trustee is aiming to do this in the most sustainable way as possible.

The Trustee supports the goals of the Paris Agreement that seeks to limit warming to well below 2°C relative to pre-industrial temperatures (in particular, the goal to limit global warming to 1.5°C above pre-industrial levels, which they believe is aligned with better economic outcomes for investors). The Trustee believes that climate risk can have an impact on securing long-term financial returns and considering climate risk is in the best long-term interest of Fund members.

DB Target and Commentary

The Trustee has set a target to reduce carbon emissions intensity based on Scope 1 and 2 associated with its default portfolio, which refers to the Fund's portfolio as at 31 December 2019, by at least 45% (from 2019 levels) by 2030 and reach net zero by 2050, which is currently understood to be consistent with limiting global warming to 1.5 degrees above pre-industrial levels. Further details of the metric and rationale underpinning this target is set out in the "Metrics and Target" section of this report.

The Trustee has considered a number of actions in order to work towards the set target. Over the next 12 months, the Trustee is aiming to undertake the following actions:

- Review Mercer's progress in engaging with investment managers to understand the steps they are taking to engage with investment managers on voting and engagement activity in respect of climate change and reduce carbon exposure within the Fund's assets.
- Annual review of Mercer's ESG policies in the Fund's governing documentation including the Trustee's ESG Policy Document.
- Annually consider the suitability of the Fund's investment arrangements to achieve the agreed carbon reduction target.
- A review of the Fund's Statement of Investment Principles ("SIP"), paying particular attention to see if the ESG wording can be enhanced.
- Regularly review the climate-related risks and opportunities in the Fund and maintain compliance with regulatory requirements, with support from the Fund's advisers.

Over the next 3 years, the Trustee expects to:

- Ensure that they are well equipped with sufficient knowledge of developments around climate change risk through training and a review of skills.

DC Target and Commentary

The Trustee has set a target to reduce carbon emissions associated with the Default Investment Option by at least 45% (from 2019 levels) by 2030 and fully (i.e. to net zero) by 2050, which is currently understood to be broadly consistent with limiting global warming to 1.5 degrees above pre-industrial levels. The Trustee's target is based on Weighted Average Carbon Intensity ("WACI") metric, capturing Scope 1 and Scope 2 emissions. Further details of the metric and rationale for this target is set out in the "Metrics and Target" section of this report.

Over the next 12 months, the Trustee is aiming to undertake the following actions:

- Annual review of ESG policies in the Fund's governing documentation including the ESG Policy Document.
- Continue engagement with investment managers on voting and engagement activity in respect of climate change.
- Consider climate change risks and opportunities as part of the Triennial Investment Strategy Review due in 2026.
- The Trustee recognises a balance needs to be maintained between meeting the investment objectives of the Fund and considering these risks and opportunities.

Over the next three years, the Trustee expects to:

- Regularly review the climate-related risks and opportunities in the Fund and maintain compliance with regulatory requirements, with support from the Fund's investment advisers.
- Ensure that they are well equipped with sufficient knowledge of developments around climate change risk through training and a review of skills.

Governance

Trustee's governance approach

The Trustee has ultimate responsibility for ensuring effective governance of climate-related risks and opportunities. The Trustee maintains a Statement of Investment Principles ("SIP"), which details the key beliefs, risks and approach to considering ESG factors, such as climate change. This is reviewed on an annual basis or more frequently as required. The Trustee maintains a standalone investment beliefs document, which provides further details on the Trustee's beliefs in matters such as integration of ESG factors, stewardship and climate change.

The Trustee has in place a standalone ESG Policy Document, which sets out the Trustee's key ESG principles that have been established and the approach to considering climate risk and other ESG factors. The Trustee's key investment beliefs on ESG are:

- The Trustee believes that a sustainable investment approach is more likely to create and preserve long-term investment capital and, more specifically, that:
- ESG factors may have a material impact on investment risk and return outcomes, and these should be integrated into the investment process.
- Long-term sustainability issues, particularly climate change, present risks and opportunities that increasingly may require explicit consideration.
- Good stewardship can create and preserve value for companies and markets as a whole, hence having the potential to benefit Fund members in long-term.

Research into how climate-related risks and opportunities impact financial markets is constantly evolving and expanding. The Trustee carries out training on a regular basis to keep up to date with developments in this space. During 2025, this was covered as part of the ESG Beliefs Survey session (June) and discussion of TCFD report (September).

Over 2025/2026 the Trustee had several meetings where ESG (including climate change) was an explicit agenda item. These are set out in the top right of this page:

- June 2025: The Trustee discussed the results of the ESG Beliefs Survey (which it completed in March 2025) to assist in understanding the current range of beliefs and views on key ESG issues as well as identify gaps in their understanding (like the Taskforce on Nature-related Financial Disclosures and significant votes) and to ensure that their policies and wider strategy is aligned with their beliefs.
- June 2025: The ESG Policy Document was reviewed.

- September 2025: The 2025 TCFD report was finalised. Climate Metrics, Scenario Analysis and progress against the Climate Target were discussed in detail.

The Trustee will continue to receive training on climate-related risk as appropriate. ESG (including climate change) is an explicit agenda item, at least annually, for the Trustee and the Investment Sub-Committee.

The consideration of climate-related risks and opportunities is integrated into the wider monitoring and decision-making responsibilities of the Trustee and the Investment Sub-Committee. On at least an annual basis, the Trustee reviews the Fund's Risk Register which includes ESG risks (including climate change). The Trustee monitors carbon emissions metrics against the agreed carbon emissions reduction target annually and considers climate-related risks and opportunities in conjunction with setting the investment strategy (for both the DB and DC Sections).

The Investment Sub-Committee and the Trustee both meet at least four times a year where investment performance and risk management are reviewed, of which ESG factors, stewardship and climate change form part of the wider assessment. Some of the actions over the period include:

- Reviewing and updating the ESG Policy Document.
- Carrying out a review of the appropriateness of in-force climate change scenario analysis.
- Carrying out annual analysis of climate metrics.
- Monitor the ESG credentials of all managers the Fund invests with.
- Reviewing voting and engagement activity carried out on its behalf by the Fund's investment managers.

The Trustee takes independent investment advice from Mercer to help assess climate risks and opportunities and looks to ensure that any decisions continue to support the Fund's ability to provide pensions.

Roles of those undertaking scheme governance activities

The Trustee maintains oversight of climate related risks and opportunities by ensuring sufficient knowledge and understanding of climate change to fulfil their statutory and fiduciary obligations, and that they are keeping this knowledge and understanding up to date, putting in place effective climate governance arrangements and identifying and assessing the main climate-related risks and opportunities for the Fund in the Plan's Risk Register.

The Investment Sub-Committee ("ISC") has oversight and decision-making responsibility for the implementation of the investment strategy as well as monitoring and managing ESG risk and opportunities including climate change. The terms of reference outlines the ISC's role and responsibilities. The key activities and decisions of the ISC are reported to the Trustee board on a quarterly basis. Any decisions requiring Trustee approval will be reviewed and ratified at the quarterly Trustee board meetings.

The roles of the relevant advisers, in relation to the oversight of climate-related risks and opportunities, are summarised in the Technical Appendix.

The Trustee's process for ensuring those advising the Trustee take adequate steps to identify and assess any climate-related risks and opportunities

DB Section

The Trustee has appointed Mercer Global Investment Europe ("MGIE") as the delegated investment manager for the DB Section of the Fund. MGIE is responsible for the appointment and monitoring of a suitably diversified portfolio of sub investment managers. Those managers are in a position to engage directly with underlying companies/issuers in order to improve their performance in the medium to long term. As part of the sub-investment manager selection and monitoring process, MGIE consider the level

and extent to which sub-investment managers take into account ESG factors, including climate change, in their investment process and stewardship activities (such as voting and engagement with the underlying companies or issuers they invest in).

Mercer has been set strategic objectives by the Trustee, which include an expectation that climate-related risks and opportunities are given due consideration. An assessment of Mercer against these objectives is carried out by the Trustee annually. The Trustee assesses the Scheme Actuary and Covenant adviser's capabilities around climate change related risk on an ad-hoc basis.

The Trustee has worked with their Investment Consultant, to ensure that the appropriate governance framework is in place to consider climate change and expect to review the processes in place as part of their ongoing review of Fund documentation, notably the SIP and Investment Beliefs document.

MGIE, acting on behalf of the Trustee, will engage with underlying investment managers where they are perceived to be lagging their peers in terms of ESG integration and climate risk management, and to ensure the investment managers are voting and engaging with the investee companies.

The Trustee, with support from the sponsoring employer's benefits team, is responsible for ensuring that sufficient time is allocated for consideration and discussion of climate matters by the Trustee and its advisers. Climate change topics, amongst other ESG topics, form a standing annual agenda item on the Trustee's meeting schedule, covering the various workstreams listed below. Those responsible for each workstream will make sure any documents or information is distributed in advance of the meeting to allow the Trustee time to digest the advice.

DC Section

The Trustee monitors the investment managers on a regular and ongoing basis, including with respect to ESG factors, stewardship and climate change. This includes the Investment Adviser's ESG credentials which measure the extent to which ESG factors are relevant to the underlying investments and the impact this may have on the risk and return outcomes of strategies. It also assesses whether ESG factors are fully integrated into investment due diligence, and whether key decision makers will take this information into account in their decision-making process on a consistent basis. The investment managers have been appointed based on their credentials, which includes the integration of ESG factors (where relevant).

The Investment Adviser has been set strategic objectives by the Trustee, which includes an expectation that ESG factors, stewardship and climate change risks are given due consideration. An assessment of these objectives (and an assessment of the Investment Adviser against these objectives) is carried out by the Trustee on an annual basis.

The Trustee has worked with their Investment Adviser to ensure that the appropriate governance framework is in place to consider climate risks and expect to review the processes in place regularly.

The Trustee or the Investment Adviser, acting on behalf of the Trustee, will engage with underlying investment managers where they are perceived to be lagging their peers in terms of ESG integration and climate risk management, and to ensure the investment managers are voting and engaging with the investee companies in accordance with the principles underlying the UK Corporate Governance Code and the UK Stewardship Code, in respect of all resolutions at annual and extraordinary meetings.

The Trustee applies the appropriate amount of scrutiny, challenge and discussion to advice relating to climate related risks. Further, the Trustee is satisfied that the amount of governance time spent is reasonable and will allocate more time at future meetings if any analysis or wider industry research requires additional review and consideration.

Strategy

Summary of the Fund's DB Section Assets

The Trustee has appointed Mercer Global Investment Europe ("MGIE") as delegated investment manager for the DB Section of the Fund.

The Trustee implemented a change to the long-term investment objective to achieve a funding position of 105% on a gilts +0.5% p.a. ("low-risk basis") by the period 31 March 2030 to 31 March 2038. As a result of this the Trustee agreed to re-risk the investment strategy and target a return of gilts +1.8% p.a. (net of underlying investment manager fees) for the overall portfolio. Significant changes were made to the strategy of the Fund year.

As at 31 December 2025, the target allocation was 36% in growth assets (2024: 20.6%) and 64% in matching assets (2024: 79.4%). The increase in the allocation to growth assets is a result of re-risking the strategy to meet the long-term investment objective.

Figure 2: Summary of assets within the DB Investment Strategy as of 31 December 2025.

May not sum to 100.0% due to rounding. Growth assets are different from their target allocation noted above given its actual allocation rather than the target. The default portfolio used for the purposes of the climate targets refers to the Fund's portfolio as at 31 December 2019.

Summary of the Fund's DC Section Assets

The DC Section's investment arrangements are managed and provided by Fidelity International Limited ("Fidelity") under a bundled arrangement.

As a minimum, the scope of reporting for DC arrangements is expected to cover popular arrangement(s), which is considered to meet one of the following criteria:

- £100m or more of invested DC assets; or
- accounts for 10% or more of the assets used to provide money purchase benefits.

For the purposes of this report, the Trustee has considered the component funds of the Default Investment Option, the Roche Flexible Retirement Lifestyle Strategy, as in aggregate, this strategy meets both of the criteria listed above. Note that the BlackRock Cash Fund has not been included in the analysis contained in this report (c.2% of total DC Section assets and c.1% of the Roche Flexible Retirement Lifestyle Strategy).

Figure 3: Summary of assets within the Default Investment Option as at 31 December 2025.

The vast majority of assets in the DC Section of the Fund are invested in the Default Investment Option, the Roche Flexible Retirement Lifestyle Strategy. The underlying funds that make up the Default Investment Option have c.80% of assets invested, more details on this can be found in the Appendix. The remaining c.20% of assets (this includes alternative lifestyles and self-select fund assets) have not been included within the analysis contained in this report.

Note that only the component funds of the Default Investment Option, the Roche Flexible Retirement Lifestyle Strategy, have been included in the analysis contained in this report, and this excludes the BlackRock Cash Fund. Cash funds typically hold short dated fixed income instruments, the turnover in these portfolios is extremely high and the duration of these instruments can be as short as a few weeks, therefore in our view, conducting climate analysis on a cash fund at a single point in time could be misleading regarding its actual decarbonisation progress.

Time periods which the Trustee have determined should comprise the short, medium and long term:

DB Section

The Trustee believes it is important to understand how the Fund's exposure to climate-related risks may change over time, when the risk exposure may be greatest and what actions can be taken now, or in the future, to avoid those risks becoming financially material to the Fund.

To help with this assessment, the Trustee has defined short-, medium- and long-term horizons for the Fund, which are detailed below:

Term	Duration (Definition)
Short	5 years (covers the period to 2030, when the Trustee expects to have made progress towards reaching full funding on the low-risk basis).
Medium	20 years (covers the period to 2045, when the Trustee expects to be well funding on the low-risk basis).
Long	40 years (covers the period where the total benefits paid will reduce as the membership ages).

DC Section

The time horizons identified by the Trustee for the purpose of the scenario analysis contained in this report are detailed below. The Trustee has selected these time horizons in order to represent members of the DC Section of the Fund at different stages in their careers.

Term	Duration (Definition)
Short	5 years (representative of a member at or very close to retirement age).
Medium	10 years (representative of a member approaching retirement age).
Long	20 years (representative of a member in the "mid-career" stage).

Climate-related risks and opportunities the Trustee has identified over the short, medium and long term

The Trustee recognises that the risks and opportunities arising from climate change are diverse and continuously evolving. This is demonstrated well in the chart below which was taken from the Final Report issued by the TCFD.

Climate-related risks and opportunities.

Source: Final Report, Recommendations of the Task force on Climate-related Financial Disclosures (June 2017).

As a long-term investor, the Trustee recognises the risks and opportunities arising from climate change are diverse and continuously evolving. Climate change presents risks over the short, medium and long-term, which the Trustee aims to better understand and mitigate where possible.

Over the short term – transition risks may present themselves through rapid market re-pricing relating to climate transition as scenario pathways become clearer, market awareness grows, policy changes unexpectedly surprise markets, market sentiment is shocked, and there is a perceived or real increased pricing of greenhouse gas emissions. The substitution of existing products and services with lower emission alternatives may impact part of the portfolio, litigation risk relating to dangerous warming may become more prevalent and there may be increases in the energy/heat efficiency of buildings and infrastructure.

The ability of the Trustee and investment managers to consider these short-term changes can position the Fund favourably, for example taking advantage of the climate transition by avoiding and reducing investment in high-emitting carbon sensitive businesses that do not support the transition to a low carbon economy (where available and appropriate). For the DC Section, investments in transition aligned strategies may provide the Default Investment Option a partial hedge against climate transition risks.

Over the medium term – transition risks associated with the transition to a low carbon economy are still likely to dominate. These include the development of technology and low carbon solutions. Policy, legislation and regulation are likely to also play a key role at the international, national and subnational level.

Technology and policy changes are likely to produce winners and losers both between and within sectors. Advancement of transition is likely to have started to crystallise stranded asset risks over the medium term.

Over the medium term, the risks and expected impacts associated with transitioning to a low carbon economy gradually give way to the physical impacts associated with climate change.

For the DC Section, the sector divergence graphic shown in the Appendix highlights (using benchmark indices) how the sector exposures of the equity components of the Default Investment Option are expected to perform across the various scenarios. The ability of the Trustee and investment managers to understand the potential impacts within different sectors can position the Fund favourably. The Trustee seeks to select managers and choose indices (where available and appropriate) that can identify potential emergence of low carbon opportunities and the decline of some traditional sectors.

Over the long term – physical risks are expected to come to the fore. This includes the impact of natural catastrophes leading to physical damages through extreme weather events. Availability of resources is expected to become more important if changes in weather patterns (e.g. temperature or precipitation) affect the availability of natural resources such as water. A changing climate may directly impact the viability of some assets or business models (for example, flood risk for real estate, or drought / fire risk for timberland assets).

Over the long term, physical impacts become increasingly significant, with the Failed Transition resulting in significant falls in asset value, in particular for the DC Section. Despite the short-term negative impacts associated with a Rapid Transition scenario, it's notable that the physical risks under the Failed Transition significantly outweigh these over the long-term.

The results of the scenario analysis (see Appendix) highlight the importance of the Trustee continuing to monitor the risks and opportunities associated with climate change on behalf of members. The Trustee will continue to weigh up these risks and opportunities (and how they are likely to present themselves over the short, medium and long-term) against the wider array of risks to be considered in helping members achieve their long-term retirement goals. As part of this process, the Trustee will engage with the underlying investment managers to ensure these risks and opportunities are being appropriately considered.

Climate-related risks and opportunities relevant to the Fund over the agreed time periods and the impact of these on the Fund's investment strategy

DB Section

Climate-related Risks

One of the greatest impacts to the Fund from climate change is investment risk. The performance of the Fund's investments is directly aligned to the value of the underlying assets, which are increasingly impacted by climate-related risks and opportunities.

MGIE ensures that the Fund's investment strategy is well-diversified and applies ratings to the investment managers to reflect that they have an appropriate understanding of both the companies and assets in which they invest in and the risks to which they are exposed.

The Trustee monitors on an annual basis the carbon intensity of the Fund's portfolio and how this changes over time, where the information is available. The carbon intensity for each of the component funds has been reported (where available) within the "Metrics and Targets" section of this report.

Climate-related Opportunities

There are significant opportunities for investing in companies and assets that may benefit as financial markets transition to a lower carbon environment.

The Fund is currently invested in the Mercer Passive Sustainable Global Equity Fund, which seeks to access listed equity investments. In addition, the Fund has an allocation to PIP IV Sustainable Opportunities since 2017, which targets unlisted investments.

Under the fiduciary management arrangement, MGIE assesses whether there are attractive sustainability-orientated investment opportunities on an ongoing basis.

Addressing Future Risks and Opportunities

In partnership with MGIE, the Fund seeks to make further progress in this area specifically for reducing climate-related risks over the short to medium term. For example:

- (i) Liaising with investment managers around reducing the carbon exposure of their portfolios (where available and appropriate);
- (ii) Allocating to more sustainable assets;
- (iii) Investing with managers that can demonstrate a higher degree of integration for Environmental, Social and Governance issues.

The Trustee expects Mercer, as the Fund's investment adviser, to provide support and consider potential investment and implementation opportunities to reduce the Fund's exposure to climate-related risks over time.

However, the Trustee recognises a balance is needed to be maintained between meeting the investment objectives of the DB Section of the Fund and considering these risks. Climate-related risks, but also opportunities, will be monitored as part of regular investment strategy reviews for the Fund.

The Trustee has investigated the potential impacts of these risks and opportunities in the Scenario Analysis that can be found in the Appendix.

DC Section

Climate-related Risks

One of the greatest impacts to the Fund from climate change is investment risk. The performance of the Fund's investments is directly aligned to the value of the underlying assets, which are increasingly impacted by climate-related risks and opportunities. The Trustee ensures that the Fund's investment strategy is well diversified, and that the investment managers have an appropriate understanding of both the companies and assets in which they invest in and the risks to which they are exposed. The Trustee aims to, where possible and appropriate, seek to maximise exposure to positive ESG factors and seek to reduce carbon exposure within the Fund's Default Investment Option.

The Trustee monitors on an annual basis the carbon emissions of the Fund's Default Investment Option and how this changes over time, where the information is available. The carbon emissions for each of the component funds used in the Default Investment Option has been reported within the "Metrics and Targets" section of this report.

Climate-related Opportunities

There are significant opportunities for investing in companies and assets that may benefit as we transition to a lower carbon environment. As part of the DC Section's previous triennial investment strategy review that was carried out in 2023, the Trustee agreed to make further enhancements to the Fund's ESG integration by increasing allocations to ESG-tilted funds, these changes were implemented in December 2023. More information is available in the [2024 TCFD report](#).

Addressing Future Risks and Opportunities

The Trustee acknowledges that further progress can be made in this area specifically for reducing climate-related risks over the short to medium term. For example:

- (i) Adjusting benchmarks that the passive funds track to lower carbon intensive benchmarks (where available and appropriate);
- (ii) Allocating to more sustainable assets within the Default Investment Option, additional lifestyle strategies and self-select fund range.

Specifically, the following risks and opportunities have been identified:

- (i) Over the short-term, the Trustee identified the inter-related risk of climate transition risk and asset repricing risk as being most relevant to the investment strategy. Over this time period, opportunities are most likely to occur in transition related investment such as climate solutions.
- (ii) Over the medium-term, the Trustee concluded that both transition risk and physical risk (particularly in the form of asset repricing to allow for future physical damage) could be material.
- (iii) Over the long-term, the Trustee identified physical risk as the key driver.

The Trustee notes that the impacts will differ across the DB and DC Sections and that the DC Section is likely to be impacted to a greater extent over longer terms, given the expected investment strategy needed to generate good member outcomes for DC members, and the expected longer lifetime of the DC Section.

The Trustee recognises a balance needs to be maintained between meeting the investment objectives of the Fund and considering these risks.

Covenant Scenario Analysis

The principal sponsor of the Fund, Roche Products Limited (RPL), is part of Roche AG (the Group), a global healthcare business, headquartered in Switzerland. The Group has a long-standing strength in oncology medicines, supported by its development into other therapeutic areas (such as immunology, neuroscience, hemophilia and ophthalmology) and its position as a world leader in diagnostics.

The London Stock Exchange Group's ESG report on the Group's performance awarded the Group a score of A+ for 2025 (FY24: A+), based on the Group's reported information in the environmental, social and corporate governance pillars (ESG Score) with an ESG Controversies overlay. Credit Rating Agencies continue to give the Group a strong investment-grade rating (Moody's Aa2, Fitch AA, and S&P AA), all with a stable outlook, with Moody's rating the Group's credit impact score from ESG issues as CIS-3, indicating that ESG attributes overall were considered to be having limited impact on the credit rating.

RPL sells the Group's pharmaceutical products in the UK and is reimbursed for the development of the Group's products. Therefore, it is reasonable to expect that RPL and the Fund's other sponsoring employers (Roche Diagnostics Limited and Roche Diabetes Care Limited) will be exposed to similar climate-related risks and opportunities as the wider Group due to this operating and financing structure.

As a part of the Group's reporting and ongoing monitoring, the Group prepares an annual report containing its Sustainability, TCFD and Governance reporting, which considers its potential exposure to climate risks (which are quantified where possible), the potential mitigating actions it can undertake with respect to those risks, as well as any opportunities available to the Group.

Grant Thornton has considered the information contained within this report, along with information obtained from external sources, to frame the comments below.

Risks and Opportunities

The Group's potential exposure to climate risks, mitigating actions and opportunities are considered from both a physical and transitional perspective.

In 2025, the Group continued to apply a phased and increasingly quantitative approach to the assessment of physical climate risks. The analysis prioritised the Group's key production and research

sites, assessing exposure to nine acute and chronic climate-related hazards, including flooding, extreme precipitation, windstorms, drought, heat stress, wildfires and cold events.

The assessment indicated that the most prevalent physical risks are associated with precipitation and flooding, followed by heat and drought, with exposure particularly notable at certain sites in North America and Asia. While some hazards – notably extreme heat, flooding and windstorms – were assessed as having potentially severe or catastrophic impacts, their likelihood in the short to medium term remains low, reflecting both geographic factors and existing mitigation measures.

The Group conducted scenario testing at three specific time periods – Current, 2030 and 2060 – and under three emissions / global warming scenarios – low (optimistic), medium (realistic) and high (pessimistic)¹.

Under this analysis, no material residual physical risks requiring near-term action were identified. Elevated residual risks were only observed under high-emissions scenarios in the long term (2060), providing sufficient lead time for further adaptation planning.

The Group therefore concluded that physical climate risks do not present a material risk to the resilience of the business model in the short or medium term. Nevertheless, the Group continues to take a precautionary approach, strengthening preparedness through emergency response planning, business continuity management, severe weather preparedness checklists and targeted site-level adaptation measures, supported by employee training and scenario-based drills.

In addition, during 2025 the Group expanded its analysis to a company-wide climate hazard exposure assessment covering 228 sites, enabling the prioritisation of locations with higher exposure and supporting more granular site-level resilience planning over time. Transition climate risks and opportunities arise from the global shift toward a low-carbon, resource-efficient and sustainable economy. In 2025, the Group continued its phased approach to transition risk assessment, with a focus on building a consistent, Group-wide understanding of how policy, regulatory, market, technology and reputational changes could impact operations and financial performance over the short, medium and long term.

Key transition risks identified include:

- increasing and volatile energy and carbon costs, driven by evolving carbon pricing mechanisms, energy market disruption and infrastructure constraints;
- regulatory and policy developments, including enhanced climate disclosure, sustainability standards and environmental performance requirements across key jurisdictions; and
- shifts in customer and market demand, particularly increasing expectations for low-emission, energy-efficient and sustainably designed healthcare products and services, which could affect competitive positioning if not addressed.

Quantitative scenario analysis compared a business-as-usual emissions pathway with the Group's Science Based Targets initiative (SBTi)-aligned transition plan. The analysis demonstrated that implementing the transition plan materially reduces exposure to future carbon pricing and energy cost volatility, particularly over the medium to long term, when compared with a no-additional-action scenario.

¹ 'Low emissions' scenario assumes Shared Socioeconomic Pathways (SSP) of 1–1.9, projecting global warming to be limited to around 1.5°C by 2100 compared to pre-industrial levels, with net-zero CO₂ emissions reached by mid-century. 'Medium emissions' scenario assumes SSP of 2–4.5, forecasting global warming between 2.0°C and 3.0°C compared to pre-industrial levels by 2100. 'High emissions' scenario assumes SSP of 5–8.5, forecasting global warming above 4.0°C compared to pre-industrial levels by 2100.

The Group also recognised that the risks outlined above also presented opportunities for improvement and growth, noting that shifts in customer demand for low-emission and energy efficient products presents the opportunity for growth in market share and that increasing performance through both on-site renewable energy installations and circular, energy efficient design has the opportunity to both reduce supply chain dependence, enhances resilience to disruptions and improves market competitiveness.

Metrics and Targets

RPL's ESG strategy is closely aligned with that of the Group and in 2025, the Group submitted the near- and long-term emissions reduction targets to the SBTi for validation. The Group's Sustainability Report for the year ended FY25 noted that its main environmental goals were as follows:

- Reduce greenhouse gas (GHG) emissions by 90% across scopes 1, 2 and 3 by 2045;
- Achieve zero scope 1 and 2 CHG emissions by 2050; and
- Continue to implement the 'decarbonisation roadmap' initiated in 2023, which includes improving scope 3 data.

In 2025, the Group's scope 1 and 2 GHG emissions decreased by 34%, with this material decrease driven by the implementation of site-level CO₂ reduction and efficiency projects, increased electrification of the European fleet and achieving 100% sustainable electricity coverage across its sites. Scope 3 GHG emissions decreased by 4% compared with 2024 primarily due to lower capital project spend and an increased proportion of electricity generated by renewable sources in customer energy grids.

The Fund

At 31 December 2025 the funding level of the Fund on the gilts + 0.5% p.a. basis was c.94% taking account of the changes to the actuarial valuation basis and long-term investment objectives of the Fund. Over the year the Trustee considered the investment strategy and, post-year end, implemented changes which included an increased allocation to growth assets and diversification of the credit assets in order to increase the expected return.

Conclusion

The London Stock Exchange Group data gave the Group a high rating from a sustainability perspective. Together with the information from the Group's TCFD and Sustainability information contained within the Annual Report, the Trustee, alongside its covenant adviser Grant Thornton, considers that the overall covenant risk arising from climate related factors continues to be low at this point in time.

This takes into consideration the Fund's strong funding position at 31 December 2025 of 94% on a gilts + 0.5% basis.

Whilst we have assessed the climate related risk as low at this point in time, this will continue to be monitored regularly.

Scenario Analysis – DB Section

Testing the resilience of the investment strategy

The Trustee supports the goals of the Paris Agreement that deliver a well below 2°C temperature increase and believes that climate-risk may impact on securing long-term financial returns and considering climate-risk is in the best long-term interests of members.

Climate change scenario analysis, as modelled by Mercer, has been undertaken on the Fund's portfolio as at 31 December 2025, to assess the potential implications of climate change under four scenarios (Rapid, Delayed, Limited and Failed Transitions) and over three time periods (5, 20 and 40 years).

	Rapid Transition	Delayed Transition	Limited Transition	Failed Transition
Summary	Highly ambitious low-carbon policy and rapid technology transition. Sudden divestments in 2026 to align with the Paris Agreement goals have disruptive effects on financial markets with sudden repricing followed by stranded assets and a sentiment shock .	Limited additional action until 2030 , at which point a highly ambitious set of low-carbon policies is introduced. Financial markets price in transition and physical risk in 2030 to align with the ambitious policy change, associated with stranded assets and a sentiment shock .	Emissions targets and commitments are not fully met. Financial markets price in climate-related risks in 2030 and 2039 as the scale of future risks become more widely accepted and understood.	No new climate policies are enacted , but transition progresses on economic grounds. Financial markets price in climate-related risks in 2030 and 2039 as the scale of future risks become more widely accepted and understood.
Temperature change	Average temperature increase stabilises at 1.6°C from 2050 onwards.	Expected increase of 1.9°C by 2100.	Expected increase of 2.9°C by 2100.	Expected increase of 3.7°C by 2100.
Expected Emission and energy production	Net Zero by 2056. Cumulative emissions of c. 500GtCO ₂ by 2064. 92% of energy production from various renewable sources (excluding nuclear) by 2060.	Cumulative emissions of c. 940GtCO ₂ by 2064. 91% of energy production from various renewable sources (excluding nuclear) by 2060.	Cumulative emissions of c. 1,490GtCO ₂ by 2064 54% and 82% of energy production from various renewable sources (excluding nuclear) by 2040 and 2060 respectively.	Cumulative emissions of c. 1,750GtCO ₂ by 2064 51% and 75% of energy production from various renewable sources (excluding nuclear) by 2040 and 2060 respectively.
Key policy & tech assumptions	A highly ambitious low-carbon policy and rapid technology transition. Higher carbon prices, larger investment in energy	Limited additional action until 2030, when a highly ambitious set of low-	Moderate policy steps taken to increase climate action including working towards 2030 targets but commitments are	Existing policy regimes are continued with the same level of ambition, with no new policies enacted.

	efficiency and faster phase out of coal-fired power generation	carbon policies is introduced. The world is faced with moderate impacts from extreme weather events and temperature change.	not fully met because policy actions are too weak and not urgent enough.	
Financial climate modelling	Pricing in of transition and physical risks over the coming 40 years occurs within one year in 2026. As a result of this aggressive market correction, a confidence shock to the financial system takes place in the same year.	Pricing in of transition and physical risks occurs in 2030. As a result of this aggressive market correction, a confidence shock to the financial system takes place in the same year.	Pricing in of transition and physical risks occurs at two different timepoints: 2030 (risks of first 40 years) and 2039 (risks of 40-80 years).	Physical risks are priced in two different timepoints: 2030 (risks of first 40 years) and 2039 (risks of 40-80 years).
Impacts on inflation	Transition risk is associated with inflationary pressures over the short-term. Transition costs, including policy costs (e.g. carbon pricing) and costs associated with deployment of new low-carbon technologies, modestly increase short-term inflation under the Rapid and Delayed Transition scenarios.		Chronic physical risk is associated with inflationary pressures over the medium- to long-term. Higher projected temperatures reduce agricultural yields and drive up food prices, increasing medium- to long-term inflation under the Limited and Failed Transition scenarios (Kotz et al., 2024).	
Physical risks considered	Physical risks are regionally differentiated and increase dramatically with rising global temperature. Physical risks are built up from: Gradual physical impacts associated with rising temperature (agricultural, labour, and industrial productivity losses) Economic impacts from climate-related extreme weather events The Failed Transition incorporates the adverse effects of hitting multiple climate tipping points (e.g. collapse of the Greenland and West Antarctic ice sheets, the collapse of East Antarctic subglacial basins, loss of mountain glaciers, Amazon rainforest dieback, and boreal permafrost collapse). Risks such as climate-related migration and conflict are not captured.			

At a market level transition risks are reasonably priced in, however longer-term physical risks are more likely to be mispriced. Transition risks remain at sector level and at the market level due to the potential for more extreme transition scenarios to occur. We express this view by modelling scenarios relative to a baseline scenario. Mercer's baseline assumes a composite scenario with the following weightings priced in: 5% Rapid Transition, 35% Delayed Transition, 15% Limited Transition, 10% Failed Transition and the remaining 35% represents no/low impact scenarios and the potential for the transition to have an overall positive impact.

DB Section:

Strategic Asset Allocation

The chosen scenarios help the Trustee understand the resilience of the Fund's portfolio to different potential warming pathways covering eventual temperature increases over different timeframes. While a lower warming pathway (sub 2°C scenario) is one which governments, businesses and society should aim for, there is a possibility that a failure to reduce greenhouse gas emissions quickly enough could set off irreversible feedback loops that significantly warms the planet (c.4°C scenario).

The Trustee notes that the modelling may understate the true level of risk and uncertainty is likely to be greater for higher warming scenarios, in particular due to the difficulty in being able to accurately predict the future. Please note, climate-related scenario analysis is an ever-evolving space and as such the scenarios modelled may be subject to review in future periods.

The table below shows the asset allocation as at 31 December 2025 modelled for the Roche Pension Fund, DB Section. The allocation is a set of target allocations for various asset classes and is focussed more on the long-term returns of the Fund's portfolio. The projections assume no further de-risking of the investment strategy. The projections also take into account the Fund's liabilities, hence charts plot the Funds gilts + 0.5% basis funding level.

Strategy Modelling

Fund Asset Class	Modelling Asset Class	(%)
All World Global Equity	MSCI ACWI Equity	7.3%
Emerging Markets Equity	Emerging Markets Equity	0.7%
UK investment Grade Credit	UK Investment Grade Credit	29.0%
Global Investment Grade Credit	Global Investment Grade Credit	11.8%
Multi-Asset Credit (MAC)	Multi Asset Credit	3.7%
Global High Yield Bonds	Global High Yield Credit	2.4%
UK Sovereign Bonds (Gilts)	LDI	24.0%
UK Index-Linked Sovereign Bonds (Index-Linked Gilts)		
Cash		
Emerging Market Debt (Hard Currency)	EMD Hard Currency	2.2%
Global Private Debt	Global Private Debt	6.4%
Private Equity	Private Equity	2.4%
World Private Infrastructure Equity	Private Infra Global	2.1%
Sustainable Private Infrastructure Equity	Sustainable Private Infrastructure	0.6%
Broad Commodities	Commodities - BCOM Mix	1.2%
Hedge Funds	Hedge Funds	6.1%

Funding Level Projection

10 Year Projection (G+0.5% basis)

40 Year Projection (G+0.5% basis)

The two graphs above show the projected funding level of the Fund on the gilts + 0.5% basis over a 5, 20 and 40 year period taking into account the different transition scenarios alongside the baseline.

Key points at different time frames

5 Years - Over this time period, transition risk is most important. Under the Rapid Transition scenario there is a shock of c.4.3% followed by a partial recovery in 2027, leading to a c.1.0% negative impact on the G+0.5% basis funding level by 2030.

20 Years - At this timepoint physical risk begins to be priced in. At the 20-year timepoint the projected funding position drops by c.15.5% under the Failed Transition scenario.

40 Years - Over the long term, physical damages are the dominant driver and the Failed Transition is the worst scenario. Failed Transition **reduces** the funding level by c.100.8%.

Impact Summary

The table below sets out the potential impact of the four climate scenarios on cumulative relative investment returns and the G+0.5% basis funding position (caused by financial factors).

	Investment relative return impact driven by financial factors	Absolute Cumulative funding level impact driven by financial factors
Rapid Transition		
Short Term (end-2030)	-0.5%	-1.0%
Medium Term (end-2045)	0.9%	-0.7%
Long Term (end-2065)	1.9%	0.5%
Delayed Transition		
Short Term (end-2030)	0.9%	1.1%
Medium Term (end-2045)	-0.3%	-3.5%
Long Term (end-2065)	-0.8%	-20.8%
Limited Transition		
Short Term (end-2030)	1.0%	1.1%
Medium Term (end-2045)	-3.6%	-7.6%
Long Term (end-2065)	-5.7%	-49.3%
Failed Transition		
Short Term (end-2030)	0.9%	1.0%
Medium Term (end-2045)	-7.0%	-15.5%
Long Term (end-2065)	-11.7%	-100.8%

The analysis above takes into account the impact of interest rates and inflation expectations upon the value of the liabilities. Of note, realised inflation is expected to be elevated under the Failed Transition, resulting from damages to agriculture and changes in food prices, increasing the value of benefits with inflation-linked increases. These impacts are fully hedged by the Fund's allocation to Liability Driven Investment holdings. It does not, however, explicitly take into account the impact of changes to mortality. Initial research commissioned by Mercer suggests that climate impacts, solely from temperature changes (e.g. hot/cold related deaths), are unlikely to significantly impact a typical UK DB scheme's funding. This does not, however, take into account wider macro-economic and health related impacts of climate change, which remains an area of active investigation.

The Fund's portfolio is well insulated against the impact of climate change under each scenario, with the funding level estimated to be over 100% under every scenario and timeframe. The Trustee acknowledges that this analysis is subject to assumptions and limitations and will continue to monitor developments in the area of climate scenario analysis so that the resilience of the investment and funding strategy reflect the latest available information.

Risk Management

DB Section

Process for identifying and assessing climate-related risks

The Trustee recognises that climate-related risks can be financially material and that the due consideration of climate risk falls within the scope of the Trustee's fiduciary duty. Given the long-dated nature of the Fund's investments and the timeframe in which climate risks could materialise, a total portfolio approach to risk management covering all sectors and all relevant asset classes has been taken.

The Investment Sub-Committee and the Trustee both seek to identify and assess climate change-related risks from both a top-down and bottom-up perspective. The climate change scenario modelling (provided in last year's report) provides a top-down strategic assessment of climate change risks. From a bottom-up perspective, the Trustee and MGIE seeks to identify key sources of company and sector-level carbon risks using carbon emissions analysis and non-carbon emissions climate-related metrics (described in the 'Metrics and Targets' Section of this report).

The Trustee receives quarterly investment performance reporting, which includes Mercer investment manager ratings produced by the Investment Adviser. These ratings take into account the extent to which managers integrate ESG considerations, including climate change, into their investment processes and stewardship activities. If a manager is considered to be "lagging the market", the Investment Adviser will engage with the relevant investment manager(s) to encourage improvements in their policies and practices in this area.

The Trustee receives an annual ESG review which considers relevant ESG indicators for the funds available through the DB Section and the extent of ESG integration within the investment managers' strategies.

The Trustee also undertook an ESG Beliefs Survey to identify gaps in their understanding and to ensure that their policies and wider strategy is aligned with their current beliefs.

A summary of the investment managers' voting statistics for all funds (with equity holdings) and significant votes cast over the year are disclosed in the Fund's Implementation Statement which is reviewed on an annual basis by the Trustee.

The Trustee annually reviews Fund documentation including the SIP, the ESG Policy Document, investment beliefs and Risk Register. The Trustee is happy that their ESG beliefs are consistent with the policies set out in the SIP. The Risk Register is used to identify, prioritise, manage and monitor risks associated with the Fund and the escalations of risk are managed by internal controls in place.

Trustee's process for managing climate change-related risks

The Trustee manages risk by prioritising those risks that it believes may be most financially material to member outcomes. Climate change is one of the risks that the Trustee considers alongside other financially material risks. These risks are identified in the SIP. In addition, the Trustee reviews the Fund's Risk Register annually to ensure that risks are effectively managed.

The Trustee's approach to climate change risk management is guided by climate change scenario modelling, climate metrics analysis and an assessment of a manager's ability to integrate ESG issues, including climate change considerations, into their investment processes.

The Trustee and MGIE equally sees its target to reduce the level of carbon emissions within the Fund, as a means to manage climate transition risks. Equally, the Trustee and MGIE expect companies in which they invest to manage climate change risks.

The Trustee recognises the challenges with various metrics, tools and modelling techniques used to assess climate change risks. The Trustee aims to work with its Investment Adviser and investment managers to continuously improve the approach to assessing and managing risks over time as more data becomes available.

The Trustee does not directly use stewardship to manage climate-related risks, rather MGIE, as the Fund's fiduciary manager, is expected to employ stewardship as a risk management tool on behalf of the Trustee.

Both climate-related risks and wider investment risks are considered as important by the Trustee. Where possible, climate change and wider investment risks such as demographic trends are treated in a holistic manner by recognising, they are often interrelated. The table below summarises the primary climate-related risk management processes and activities.

Governance	- The Trustee's Statement of Investment Principles is reviewed at least annually and sets out how ESG risks including climate change are managed and monitored. - The Trustee maintains a Risk Register to monitor and mitigate financially material risks to the Fund. On at least an annual basis, the Trustee reviews the Fund's Risk Register which includes reference to ESG risks (including climate change, both physical and transition risks) to ensure the assessment of the likelihood and impact continue to remain appropriate for the Fund. - The Trustee receives regular training on climate-related issues, including market updates. The training allows the Trustee to better understand how climate-related risks and opportunities can have an impact on the Fund. - The Trustee has developed a standalone ESG Policy Document, which sets out the Trustee's key ESG principles that have been established and the approach to considering climate risk and other ESG factors. This policy is reviewed on an annual basis. - The Trustee undertakes semi-regular ESG Beliefs Surveys, the last survey was completed in March 2025. The Trustee believes that sustainable investment decisions are aided through establishing a foundation of clearly articulated ESG beliefs.
Strategy	- The Investment Adviser will take ESG risks and opportunities (including climate change) into account as part of any wider strategic investment advice provided to the Trustee. This includes highlighting the expected

	change in climate-risk exposure through proposed asset allocation changes. Additionally, MGIE as the Fund's fiduciary manager takes account of climate-related issues when considering portfolio construction. - Climate scenario analysis will be reviewed at least triennially, or more frequently if there has been a material change to the strategic asset allocation and/or the arrangements. An updated analysis has been completed due to the material change to strategic asset allocation. - The Trustee has set strategic objectives for its Investment Adviser which includes an expectation that ESG risks and opportunities (including climate change) are given due consideration. An assessment against these objectives is carried out by the Trustee regularly.
Reporting	- Annual reports of climate-related metrics and progress against climate-related targets will be reviewed by the Trustee. The Trustee may use the information to engage with the investment managers and will take the information into account in triennial investment strategy reviews. - The Trustee produces an annual Implementation Statement which includes commentary on how the investment managers choose to vote and engage on climate-related issues (among other ESG issues), where applicable. Additionally, it provides commentary on what the Trustee deems a "significant" vote to be, in line with their stewardship priorities as well as documenting these votes. The outcomes from the stewardship monitoring are summarised in the Trustee's annual Implementation Statement.
Manager selection and retention	- MGIE will consider an investment manager's firm-wide and strategy-specific approach to managing climate-related risks and opportunities alongside other ESG factors when either appointing a new manager, in the ongoing review of a manager's appointment, or as a factor when considering the termination of a manager's appointment. - MGIE reviews investment managers on the extent of integration of ESG factors (including climate change) into their investment processes. A manager's stewardship process forms part of the rating assessment. This is considered at the firm level and at the investment strategy/fund level. The ratings are presented in quarterly investment performance reports and are reviewed by the Trustee. The Trustee also receives annually an ESG Manager Ratings review which analyses the ESG ratings of the funds comparing these against the wider universe of strategies across various asset classes.

DC Section

Process for identifying and assessing climate-related risks

The Trustee recognises that climate-related risks can be financially material, and that consideration of climate risk falls within the scope of the Trustee's fiduciary duty. Given the long-dated nature of the Fund's investments and the timeframe in which climate risks could materialise, a total portfolio approach to risk management covering all sectors and all relevant asset classes should be taken, with specific focus given to the Default Investment Option, the Roche Flexible Retirement Lifestyle Strategy, since over 80% of the total DC Section assets are invested in this investment strategy.

The Trustee seeks to identify and assess climate-related risks from both a top-down and bottom-up perspective. The climate change scenario modelling (which is carried out at least triennially, or more frequently if there has been a material change to the investment strategy) provides a top-down strategic assessment of climate risks. From a bottom-up perspective the Trustee seeks to identify key sources of company and sector-level risks using climate-related metrics (summarised in the next section).

During the reporting period, the Trustee received quarterly investment performance reporting, including ESG investment manager credentials produced by the Investment Adviser. These credentials measure the extent to which ESG factors are relevant to the underlying investments and the impact this may have on the risk and return outcomes of strategies. It also assesses whether ESG factors are fully integrated into investment due diligence, and whether key decision makers will take this information into account in their decision-making process on a consistent basis. If a manager is considered to be "lagging the market", the Investment Adviser will engage with the relevant investment manager(s) to encourage that they improve their policies and practices in this area.

The Trustee also undertook an ESG Beliefs Survey to identify gaps in their understanding and to ensure that their policies and wider strategy is aligned with their current beliefs.

A summary of the investment managers' voting statistics for all funds (with equity holdings) and significant votes for the Default Investment Option cast over the year are disclosed in the Fund's Implementation Statement which is reviewed on an annual basis by the Trustee.

The Trustee annually reviews Fund documentation including the SIP, the ESG Policy Document, investment beliefs and Risk Register. The Trustee is happy that their ESG beliefs are consistent with the policies set out in the SIP. The Risk Register is used to identify, prioritise, manage and monitor risks associated with the Fund and the escalations of risk are managed by internal controls in place.

Trustee's process for managing climate change-related risks

The Trustee manages risk by prioritising those risks that it believes may be most financially material to member outcomes. Climate change is one of the risks that the Trustee considers alongside other financially material risks. These risks are identified in the SIP. In addition, the Trustee reviews the Fund's Risk Register annually to ensure that risks are effectively managed.

The Trustee's approach to climate risk management is guided by climate change scenario modelling, climate metric analysis and an assessment of a manager's ability to integrate ESG issues, including climate change considerations, into their investment processes.

The Trustee equally sees its target to reduce the level of carbon emissions within the Fund, with a focus on the Default Investment Option (details in next section), as one possible means to manage climate risks. Equally, the Trustee expects companies in which it invests to manage climate change risks.

The Trustee recognises the challenges with various metrics, tools and modelling techniques used to assess climate risks. The Trustee aims to work with its Investment Adviser and investment managers to continuously improve the approach to assessing and managing risks over time as more data becomes available.

Both climate-related risks and wider investment risks are considered as important by the Trustee. Where possible, climate change and wider investment risks such as demographic trends are treated in a holistic

manner by recognising, they are often interrelated. The table below summarises the primary climate-related risk management processes and activities.

Governance	- The Trustee's Statement of Investment Principles is reviewed at least annually and sets out how ESG risks including climate change are managed and monitored. - The Trustee maintains a Risk Register to monitor and mitigate financially material risks to the Fund. On at least an annual basis, the Trustee reviews the Fund's Risk Register which includes reference to ESG risks (including climate change, both physical and transition risks) to ensure the assessment of the likelihood and impact continue to remain appropriate for the Fund. - The Trustee receives regular training on climate-related issues, including market updates. The training allows the Trustee to better understand how climate-related risks and opportunities can have an impact on the Fund. - The Trustee has developed a standalone ESG Policy Document, which sets out the Trustee's key ESG principles that have been established and the approach to considering climate risk and other ESG factors. This policy is reviewed on an annual basis. - The Trustee undertakes semi-regular ESG Beliefs Surveys, the last survey was completed in March 2025 and discussed at the June 2025 ISC meeting. The Trustee believes that sustainable investment decisions are aided through establishing a foundation of clearly articulated ESG beliefs.
Strategy	- The Investment Adviser will take ESG risks and opportunities (including climate change) into account as part of any wider strategic investment advice provided to the Trustee. This includes highlighting the expected change in climate-risk exposure through proposed asset allocation changes. - Climate scenario analysis will be reviewed at least triennially, or more frequently if there has been a material change to the strategic asset allocation and/or the popular arrangements. Over the year there have been no material changes to note. We have therefore not conducted the analysis for the year end 31 March 2026. - The Trustee has set strategic objectives for its Investment Adviser, which includes an expectation that ESG risks and opportunities (including climate change) are given due consideration. An assessment against these objectives is carried out by the Trustee regularly.
Reporting	- Annual reports of climate-related metrics and progress against climate-related targets will be reviewed by the Trustee. The Trustee may use the information to engage with the investment managers and will take the information into account in triennial investment strategy reviews. - The Trustee produces an annual Implementation Statement which includes information on how the investment managers choose to vote and engage on climate-related issues (among other ESG issues), where applicable. Additionally, it provides commentary on what the Trustee deems a "significant" vote to be, in line with their stewardship priorities as well as documenting these votes. The

	outcomes from the stewardship monitoring are summarised in the Trustee's annual Implementation Statement. - The Trustee produces an annual Implementation Statement which includes commentary on how the investment managers choose to vote and engage on climate-related issues (among other ESG issues), where applicable. Additionally, it provides commentary on what the Trustee deems a "significant" vote to be, in line with their stewardship priorities as well as documenting these votes. The outcomes from the stewardship monitoring are summarised in the Trustee's annual Implementation Statement.
Manager selection and retention	- The Trustee, with advice from the Investment Adviser, will consider an investment manager's firm-wide and strategy-specific approach to managing climate-related risks and opportunities alongside other ESG factors when either appointing a new manager, in the ongoing review of a manager's appointment, or as a factor when considering the termination of a manager's appointment. - The Investment Adviser's Manager Research Team reviews investment managers on the extent to which ESG factors are relevant to the underlying investments and the impact this may have on the risk and return outcomes of strategies. Furthermore, the Manager Research Team assesses whether ESG factors are fully integrated into investment due diligence, and key decision makers will take this information into account in their decision-making process on a consistent basis. A manager's stewardship process forms part of the rating assessment. This is considered at the firm level and at the investment strategy/fund level. The credentials have been presented in quarterly investment performance reports and are reviewed by the Trustee. A downgraded ESG credentials may (taking into account other factors) lead to an investment manager being put 'on watch' or removed from DC Section of the Fund.

Metrics and Targets

Metrics

The Trustee has chosen to present climate-related metrics across four different categories in this report. Climate risk metrics aid the assessment of potential climate-related risks to which the Fund is exposed, and help to identify areas for further risk management, including engagement, monitoring, retention and selection. The following metrics are provided in this report:

Metric category	Selected metric	Further detail
Absolute emissions	Total Greenhouse Gas Emissions	Tonnes of carbon dioxide and equivalents (tCO ₂ e) that the Fund is responsible for financing.
	Carbon Footprint	The amount of carbon dioxide and equivalents (tCO ₂ e) emitted per million dollars of the Fund's investments.
Emissions intensity	Weighted Average Carbon Intensity (WACI)	The exposure of the Fund to carbon-intensive companies, measuring the amount of carbon dioxide and equivalents (tCO ₂ e) emitted per million dollars of holding company / issuer revenue ¹ on average.
Portfolio Alignment	% of portfolio companies with targets approved by the Science Based Targets initiative (SBTi)	Assessment of the proportion of portfolio companies/issuers that have set net-zero targets that have been validated by SBTi. This is just used for the DC Section.
	Implied Temperature Rise (ITR)	A forward-looking assessment of how aligned the Fund's portfolios are relative to the Paris Agreement's 1.5°C target. This is estimated based on the activities and decarbonisation targets of portfolio companies / issuers, relative to what global decarbonisation needs to be to achieve 1.5°C.
Additional	Data Quality	Represents the proportions of the portfolio for which the Trustee has high quality data.
	Climate Value at Risk (cVaR)	Measures the size of the financial loss attributable to climate-related risks a portfolio may experience, within a given time horizon, if a particular scenario unfolds. This is just used for the DB Section.

¹ For sovereign bonds, Greenhouse Gas Emissions are expressed relative to Purchasing Power Parity adjusted Gross Domestic Product (PPP-adjusted GDP), for both Production and Consumption sovereign intensity for consistency with absolute emissions calculations. For sovereign consumption intensity emissions, Greenhouse Gas Emissions are also expressed on a per capita basis, in line with the Partnership for Carbon accounting of Financials guidance.

All corporate emissions-based metrics are presented across all 3 scopes:

- **Scope 1 “direct” emissions:** those from sources owned or controlled by the Company (e.g. direct combustion of fuel from vehicles); and
- **Scope 2 “indirect” emissions:** those caused by the generation of energy (e.g. electricity) purchased by the Company.
- **Scope 3 “indirect” emissions:** In this category go all the emissions associated, not with the company itself, but that occur in the value chain of the reporting company.

The Trustee has included a table which includes Scope 3 (one for the DB Section and another for the DC Section) emissions only. However, we note there are challenges with Scope 3 emissions i.e. the rate of Scope 3 disclosure remains insufficient to use reliably, and inclusion may lead to double counting at portfolio level.

For sovereign emissions, the emissions are defined as those that relate to production (Scope 1) and consumption (Scope 1, 2 and 3 minus exported emissions) in line with the Partnership for Carbon Accounting of Financials (“PCAF”) guidance. Emissions in this report are showing including and excluding those from land use, land use change and forestry.

- **Production emissions:** those attributable to emissions produced domestically and include domestic consumption and exports; and
- **Consumption emissions:** these include production emissions, minus exported emissions, plus imported emissions (emissions related to energy and non-energy imports from goods or services from outside the country territory as a result of activities taken place in the country territory).

The Trustee recognises the challenges associated with various metrics, tools and modelling techniques used to assess climate change risks. The Trustee aims to work with its Investment Adviser and investment managers to continuously improve the approach to assessing and managing risks over time as more data becomes available. The Technical Appendix of this report sets out further information on each metric along with the data limitations and assumptions used in collating these metrics.

DB Section – Metrics and Targets

The regulations require trustees to calculate and report metrics for all assets ‘as far as they are able’. The metrics presented in this report are as at 31 December 2025 and are based on the actual asset allocation at that date. Further details are included in the Technical Appendix.

This report presents direct analysis of:

- The Fund’s Mercer Pooled funds.
- The Fund’s Segregated LDI mandate, managed by BlackRock.

The above assets comprise 78.5% of the Fund’s total DB assets as at the date of analysis based on the actual asset allocation (31 December 2025).

The report does not present analysis of the Fund’s private market investments (private equity, private debt, infrastructure, sustainable opportunities) and Asset Backed Securities (“ABS”) managed by Mercer, M&G and TwentyFour, which together comprise the majority of the residual 21.5% of the asset allocation, due to issues with data quality and coverage. It is very challenging to calculate metrics for illiquid mandates and it is not expected they will be included in the analysis in the foreseeable future.

The Trustee recognises the challenges associated with various metrics, tools and modelling techniques used to assess climate change risks. The Trustee aims to work with its investment adviser and investment

managers to continuously improve the approach to assessing and managing risks over time as more data becomes available. The Technical Appendix of this report sets out further information on each metric along with the data limitations and assumptions used in collating these metrics.

Non-Sovereign Assets Climate-Related Metrics, Scope 1 & 2 (as at 31 December 2025)

Fund	Value	% of DB Section Assets	Carbon Footprint	WACI	Absolute Emissions	ITR	WACI Coverage

Total*	572.8	78.5	172.8	-	17,944.4	-	170.7	-	17,725.5	-

Source: Mercer, using data from MSCI. Sovereign emissions data shown are consistent with the Partnership for Carbon Accounting Financials (PCAF) definition of Scope 1 sovereign emissions, aligning with the UNFCCC definition of domestic territorial emissions, including emissions from exported goods and services. Emissions data are presented including and excluding land use, land-use change and forestry (LULUCF). Additional information on the approach that has been taken is set out in the Technical Appendix. Coverage denotes availability of data across eligible assets.

*BlackRock Segregated LDI is excluded from the total figure.

Emissions from total long exposure to gilts (£587.4m) are shown in the table above. Emissions associated with gilt exposure from reverse repo contracts (-£364.1m) are not included in the analysis. Gilts posted out as collateral are included in gilt valuations; gilts received as collateral are excluded. Cash and other derivative contracts have been excluded.

For production emissions including LULUCF, absolute emissions in respect of funded gilt exposure (£549.9m) are 67,239 tCO₂e. Absolute production emissions including LULUCF from additional exposure achieved through gilt repos (£37.5m) are 4,582 tCO₂e.

For production emissions excluding LULUCF, absolute emissions in respect of funded gilt exposure (£549.9m) are 67,143 tCO₂e. Absolute production emissions excluding LULUCF from additional exposure achieved through gilt repos (£37.5m) are 4,575 tCO₂e.

Sovereign Bonds – Consumption emissions, including and excluding LULUCF (31 December 2025)

Total*	78.5	12.6	-	196.9	-	20,445.0	-

Source: MGIE, for BlackRock Segregated LDI mandate: Mercer, using data from MSCI. All data is based on stocklists as at 31 December 2025, using metric calculations and data feeds as at 21 August 2025, or latest available. Sovereign emissions data shown are consistent with the Partnership for Carbon Accounting Financials (PCAF) definition of consumption emissions, equivalent to production emissions, less exported emissions, plus imported emissions. Emissions data exclude land use, land-use change and forestry. Additional information on the approach that has been taken is set out in the Appendix. Coverage denotes availability of data across eligible assets. Where mandates are synthetic, the allocation weight represents the market value of exposure.

*BlackRock Segregated LDI is excluded from the total figure.

Emissions from total long exposure to gilts (£587.4m) are shown in the table above. Emissions associated with gilt exposure from reverse repo contracts (-£364.1) are not included in the analysis. Gilts posted out as collateral are included in gilt valuations; gilts received as collateral are excluded. Cash and other derivative contracts have been excluded. Absolute emissions in respect of funded gilt exposure (£549.9m) are 101,924 tCO₂e. Emissions from additional exposure achieved through gilt repos (£37.5m) are 6,945 tCO₂e.

Climate-Related Metrics Summary

For comparison purposes the changes in corporate climate-related metrics for scope 1 and 2 emissions over the year to 31 December 2025 are as follows, all the figures are based on the data available for analysis rebased to 100% to represent full coverage.

Metric	31 December 2022	31 December 2023	31 December 2024	31 December 2025	Change (2025 relative to 2024)
Carbon Footprint (tons CO ₂ e / \$m invested)	49	50	49	57	+8.0
WACI (tons CO ₂ e / \$m revenue)	164	142	121	123	+2.0
Absolute Emissions (tons CO ₂ e)	35,393	14,130	14,224	7,557	-6,667*
ITR (°C)	2.3	1.8	2.3	2.8	+0.5
1.5°C cVaR (£m)	15.5	16.6	12.8	13.3	+0.5

*Fall in absolute emissions has been largely driven by the lack of availability of data for the new ABS managers and Trade Finance, and the sale of the Fund's exposure to the Tailored Credit I Fund as well as longer dated gilts (a significant contributor to absolute emissions in the prior report).

The Trustee makes the following observations with regards to the climate metrics:

- Over the reporting period the Trustee agreed to increase the Fund's target allocation to growth assets as a result of changes to the long-term investment objectives. Consequently, the Fund holds more growth assets. A number of these assets have higher corporate climate-related exposure. Some of the strategy changes included diversification in credit (a reduction in long dated investment grade corporate credit which attributes to the large reduction in absolute emissions) and introducing asset classes such as ABS and Trade Finance.
- The Fund's WACI increased slightly compared to the prior year from 121 to 123 (tons CO₂e / \$m revenue), this was largely driven by the increase in growth assets invested over the year. Based on the Trustee's WACI metric, as at 31 December 2025, the Trustee continues to meet its target (relative to a baseline WACI metric of 315.7).
- The 2015 Paris Agreement objectives reflect a collective goal to hold the increase in the climate's average global surface temperature to well below 2°C above pre-industrial levels and to pursue efforts to limit the temperature increase to 1.5 °C. At an aggregate level the portfolio is not currently aligned with a 1.5 °C pathway.

- At an individual fund level, a number of the Fund's investments continue to show significant improvement year on year in part due to the improvement in data quality. For example, the Multi-Asset Credit Fund saw the WACI improve by 19%, albeit coverage has been low for this fund.

Targets

The Trustee will keep the following targets under review to ensure they remain appropriate and relevant, taking into account any changes to the investment strategy of the DB Section of the Fund, the availability of data and wider market developments. The Fund's investment strategy noted in the target below refers to Fund's portfolio as at 31 December 2019.

The Trustee has set a target to reduce carbon emissions intensity associated with its default portfolio by at least 45% (from 2019 levels) by 2030 and fully (i.e. to net zero) by 2050, which is currently understood to be broadly consistent with limiting global warming to 1.5 degrees above pre-industrial levels.

The Trustee's target is based on Weighted Average Carbon Intensity ("WACI") metric, capturing Scope 1 and Scope 2 emissions, as a method of monitoring and reducing the levels of carbon exposure in line with the Trustee's fiduciary duties to invest in the best financial interests of the Fund's membership. This metric was selected due to its broader coverage and applicability across asset classes, when compared to other climate metrics.

The Trustee will be working closely with the discretionary investment manager to identify and manage a staged emissions reduction plan, oversee fund allocations to climate solutions, and steward an increase in transition capacity across the portfolio. Progress on reductions will be monitored and reported to members on an annual basis. These targets are also fully embedded within the Trustee's governance, risk management and strategy processes and communicated to relevant partners and third parties.

Furthermore, in order to meet the Trustee's net zero targets, our discretionary investment manager may use the following key levers:

- Asset class approach to implementation, e.g. for selecting strategies and mandate guidelines with consideration for climate goal alignment, and other risk and return factors, in line with Trustee fiduciary responsibility.
- Stewardship, voting and engagement tools, to ultimately target transition within company business models, as implemented via sub-investment managers.
- Allocation to investment products across various sectors which support the climate transition to a low-carbon economy.

The Trustee will keep its targets under review to ensure they remain appropriate and relevant, taking into account any changes to the investment strategy of the Fund, the availability of data, the balance between portfolio and real world decarbonisation as well as wider market developments.

Since December 2019, the WACI (corporate WACI based on Scope 1 and 2 emissions) of the Fund's portfolio has reduced by c.61% over the period since 31 December 2019 as illustrated in the table below. The Fund has achieved the interim goal of a 45% reduction in WACI by 2030, which has been driven by a number of funds receiving an Article 8 classification from the SFDR which involved carbon reduction commitments, and strengthening the ESG characteristics of the funds. The Trustee will continue to monitor progress in achieving the carbon reduction goal of net zero on at least an annual basis.

Target	31 December 2019	30 June 2022	31 December 2022	31 December 2023	31 December 2024	31 December 2025
WACI (tCO ₂ e/\$M revenue)	315.7	215.4	164.1	141.9	120.9	122.8
% Change relative to 2019 Baseline	-	-32%	-48%	-55%	-62%	-61%

DC Section – Metrics and Targets

This section presents climate metric analysis for the Fund's Default Investment Option, the Roche Flexible Retirement Lifestyle Strategy, as at 31 December 2025.

Due to practical data availability, the Fund-level figures quoted in the report assume that companies not covered by the analysis are represented within the range of companies that have been covered in the analysis, the 'pro-rata approach' (i.e. it is not assumed that companies not covered have emissions of 0) in line with statutory guidance.

The Trustee recognises that the availability of accurate data for some asset classes is an industry-wide issue and will look to engage with the investment managers to improve their climate reporting. The Trustee also recognises the challenges with various metrics, tools and modelling techniques used to assess climate change risks. The Trustee aims to work with its Investment Adviser and investment managers to continuously improve the approach as more data becomes available.

The table below sets out the results of the Trustee's climate metric analysis for the popular arrangement of the DC Section, the Roche Flexible Retirement Lifestyle Strategy, across the categories of emissions intensity, absolute emissions and portfolio alignment. The results aid the Trustee in assessing the potential climate change-related risks to which the DC Section is exposed on both a point-in-time and forward-looking basis. The Appendix contains information on limitations in relation to the reporting and collection of climate metric data.

Climate-Related Metrics – Listed Equities and Corporate Bonds – Scope 1 & 2 (31 December 2025)

	Nordea Diversified Return Fund	210.8	100.0%	1,624	100.0%	9.5%
Total sovereign bonds		210.3	98.8%	3,875	98.8%	20.6%

Source: MSCI and Mercer. All data as at 31 December 2025, or latest available. Sovereign emissions data shown are consistent with the Partnership for Carbon Accounting Financials (PCAF) definition of Scope 1 sovereign emissions, aligning with the UNFCCC definition of domestic territorial emissions, including emissions from exported goods and services. Emissions data are presented including and excluding land use, land-use change and forestry (LULUCF). Additional information on the approach that has been taken is set out in the Technical Appendix. Coverage denotes availability of data across eligible assets.

Metrics – Sovereign Bonds – Consumption emissions (31 December 2025)

The tables below set out the results of the Trustee's sovereign consumption emissions calculations for the BlackRock ESG Strategic Growth Fund, BNY Mellon Global Dynamic Bond Fund, and Nordea Diversified Return Fund covering Scopes 1, 2 and 3.

Asset Class	Mandate	Production Emissions Excluding LULUCF - Scope 1 (tCO ₂ e / \$M PPP-Adjusted GDP)		Energy Imports - Scope 2 (tCO ₂ e / \$M PPP-Adjusted GDP)		Allocation Weight
		Metric	Coverage	Metric	Coverage	
Sovereign bonds	BlackRock ESG Strategic Growth	198.3	99.0%	0.9	97.7%	9.5%
	BNY Mellon Global Dynamic Bond	224.5	96.6%	0.9	96.6%	1.7%
	Nordea Diversified Return Fund	210.8	100.0%	0.2	100.0%	9.5%
Total sovereign bonds		210.3	98.8%	0.6	98.4%	20.6%

Metrics – Sovereign Bonds – Underlying components of sovereign bond consumption emissions calculations

Asset Class	Mandate	Non-Energy Imports - Scope 3 (tCO ₂ e / \$M PPP-Adjusted GDP)		Exports (tCO ₂ e / \$M PPP-Adjusted GDP)		Allocation Weight
		Metric	Coverage	Metric	Coverage	
Sovereign bonds	BlackRock ESG Strategic Growth	64.0	97.7%	45.9	97.7%	9.5%
	BNY Mellon Global Dynamic Bond	65.8	96.6%	65.6	96.6%	1.7%
	Nordea Diversified Return Fund	55.8	100.0%	33.2	100.0%	9.5%
Total sovereign bonds		61.0	98.4%	98.4%	45.6	98.4%

Source: Mercer, using data from MSCI. All data is based on stocklists as at 31 December 2025. Sovereign emissions data shown are consistent with the Partnership for Carbon Accounting Financials (PCAF) definition of Scope 1, Scope 2, and Scope 3 sovereign emissions. Coverage denotes availability of data across eligible assets.

Progress against baseline (excluding sovereign bonds)

Notes: The dates in the above charts correspond to the last day of the year (e.g. 2026 corresponds to 31 December 2025).

The Roche Flexible Retirement Lifestyle Strategy's total listed portfolio has made the following progress against baseline (31 December 2019) as at 31 December 2025:

- Carbon Footprint **decreased by c.67%.**
- Weighted Average Carbon Intensity (WACI) **decreased by c.55%.**
- Absolute Emissions **decreased by c.28%.**

The above charts continue to demonstrate the positive effects attributed to various enhancements made to the Default Investment Option in October 2020 and December 2023. The metrics have continued to decrease during the year to 31 March 2026 however, we note an increase to Absolute Emissions compared to 2025. Assets under management have increased significantly over the period for the DC Section, leading to a larger overall portfolio and thus higher absolute emissions, even if the emissions intensity per unit of investment has decreased.

Additional Non-emissions Based Metric – Data Quality

The Data Quality metric measures the proportions of the portfolio for which the Trustee has high quality data. Data Quality also assists the Trustee in monitoring the quality of reporting over time, as companies are expected to continually improve their reporting on climate-related metrics. As data quality improves, so does the usefulness of the Fund's climate metrics.

The following methodology has been used to measure data quality; the stocklist received from the manager is analysed, and only the equity, corporate bonds, and/or sovereign portions are kept. The residual asset classes, such as cash and derivatives, are removed from the portfolio. The resulting stocklist is cross referenced vs MSCI's database to obtain data for the holdings. Not all positions are covered by the tool at this time.

Verified data is becoming increasingly available, driven by regulatory and market expectations for Scope 1 and 2 emissions. In this analysis, under MSCI's methodology, verified' indicates where there is a clear and explicit disclosure confirming third-party verification or assurance of the reported emissions data, including references to recognised assurance standards, regardless of whether the assurance level is limited or reasonable. Data categorised as "verified" was made available from MSCI in late Q4 2025.

Data Quality (31 December 2025) – Scope 1 and 2 emissions

Source: MSCI and Mercer. Data as at 31 December 2025.

More detail on the Data Quality metric is provided in the Appendix.

Data Quality for **Scope 3** emissions for listed equities and corporate bonds are entirely estimated.

Scope 3 emissions for listed equities and corporate bonds are calculated using estimated data due to the lack of availability or poor quality of reported data. Even when reported data is available for scope 3 emissions, there is no guarantee of consistency between the reported figures across different companies, as companies often only report on a subset of the 15 categories of scope 3 emissions. MSCI estimates emissions across each of the 15 categories using a combination of revenue estimates and production data. Using MSCI estimated scope 3 data only ensures that data is consistent for all companies across similar sectors, providing a more robust understanding of where the risks lie and a better intertemporal understanding of how portfolios have evolved.

Climate-Related Metrics Summary

The Data Quality graphic above shows the funds used within the Default Investment Option (with the exception of the BlackRock Cash Fund) and are within the scope of this climate change-related disclosures report.

Data quality strengthened in 2026, with verified emissions data increasing substantially across mandates. This improvement reflects enhanced market practices in emissions verification and better data availability. Verified data increased for all funds and unavailable data has been broadly similar with some improvements, the highest improvement noted for the BNY Mellon Global Dynamic Bond fund.

The passive equity funds hold the largest allocation of DC Section assets in the Default Investment Option and as such, are the largest contributor to total absolute emissions.

The L&G MSCI World Minimum Volatility Index Fund has the largest WACI of the underlying equity funds reflecting its high allocation to companies in industrials, commodities and energy.

The 2015 Paris Agreement is to keep global temperature rises to below 2 °C above pre-industrial levels, the ITR for the Default Investment Option is 2.5°C. The Trustee recognises that companies are increasingly taking steps to align with credible net zero pathways and that this will evolve over time.

There is a range of results for the percentage of companies with SBTi targets, as low as c.21% for the L&G MSCI World Small Cap ESG Exclusions Fund and as high as c.64% for the Nordea Diversified Return. Around 50% of the Default Investment Option have SBTi approved transition plans.

For the majority of the funds, SBTi figures have increased from previous year to date but the BNY Mellon Global Dynamic Bond and BlackRock Corporate Bond All Stocks. SBTi increases or decreases depend on the underlying holdings and their respective coverage. When approved targets have been terminated or newly added holdings do not have approved targets, these funds may no longer have approved SBTi targets or may have lower overall target coverage.

In summary, for Scope 1 and 2 emissions, over the 6-years to 31 December 2025:

- **The overall Carbon Footprint (tons CO₂e / \$m invested) has fallen from 76.9 to 25.7, a c.67% reduction.**
- **The overall WACI (tons CO₂e / \$m revenue) has fallen from 167.2 to 74.7, a c.55% reduction.**
- **Absolute Emissions (tons CO₂e) have fallen from 17,063 to 12,217, a c.28% reduction.**

Targets

The Trustee has selected 31 December 2019 as the “Baseline year” as this is consistent with the recommendations under The Institutional Investors Group on Climate Change (“IIGCC”). **The Trustee has set a target to reduce carbon emissions associated with the Default Investment Option by at least 45% (from 2019 levels) by 2030 and fully (i.e. to net zero) by 2050, which is currently understood to be broadly consistent with limiting global warming to 1.5 degrees above pre-industrial levels. It**

should be noted that the target applies to Scope 1 and 2 emissions and for the assets where WACI data is reportable (data coverage was c.91% of assets in the Default Investment Option in 2019 and c.99% in 2025). It should also be noted that any improvement in the consistency, comparability and quality of climate related data is likely to have an impact on the Fund's carbon metrics. The Trustee based its target on WACI for the following reasons; better, more reliable information is available for most of the funds. WACI is a relative metric and is not skewed by the size of the Fund.

The charts below show the Weighted Average Carbon Intensity (WACI) for the Default Investment Option as at 31 December 2019 (baseline) and 31 December 2025 (current). **This demonstrates the progress made over the six-year period, with WACI declining from 167.2 to 74.7 tCO₂e/million sales (Scopes 1 and 2 only), representing a c.55% reduction.** This progress is largely a result of investment strategy changes, i.e. implementing ESG-tilted developed market equities in October 2020, the removal of Standard Life GARS in September 2022 and implementing ESG-tilted emerging market equities in December 2023. It is also acknowledged that structural factors, such as fluctuations in inflation can impact the WACI evolution of a portfolio. The Trustee intends to continue engaging with managers to understand the expected pace of future decarbonisation and potential for other changes in investment allocation as climate-related risks and opportunities become clearer.

Weighted Average Carbon Intensity of the Default Investment Option as at 31 December 2019

Weighted Average Carbon Intensity of the Default Investment Option as at 31 December 2025

Notes: Scope 1+2 only. % of fund directly analysed reflects coverage under the MSCI tool used in this analysis. The figures in this analysis have been pro-rated at the individual fund level (where reasonable data is available) to present coverage as if full data were available for the listed assets. Total portfolio considers only the Equity portion only of the DGF mandates. Figures cannot sensibly be aggregated with emissions data for sovereign assets due to risk of double counting.

Conclusions and Next Steps

DB Section

The key messages from this report are:

- Climate change risk can have an impact on the long-term outcomes for the DB Section of the Fund.
- The Trustee has processes in place to identify, assess and mitigate climate change risk.
- The Fund has changed its long-term investment objective which saw an increase in the target allocation to the Growth Portfolio from 20.6% to 36%, this has been a key driver in the change in metrics.
- A target to reduce the level of carbon exposure of the DB Section of the Fund has been set, and as at 31 December 2025 the WACI has reduced by 61% compared to the baseline year of 2019. As such the Trustee will review the suitability of the target over the next reporting period.
- Climate change risks and opportunity considerations will be continued to be made by the Trustee when making decisions concerning the strategic asset allocation (i.e. annual recalibrations).
- The Trustee conducted an ESG Beliefs Survey during the year to 31 March 2025 to assist in understanding the current range of beliefs and views on key ESG issues as well as identify gaps in their understanding and to ensure that their policies and wider strategy is aligned with their beliefs. The Trustee believes that sustainable investment decisions are aided through establishing a foundation of clearly articulated ESG beliefs.

The Trustee will continue engagement and to work with investment managers in respect of the following;

- Review voting and engagement activity in respect of climate change, including 'climate-related engagements' as a criteria for investment managers to report on their most significant votes.
- Sharing information on the Fund's target and asking managers to confirm what steps they are putting in place to reduce their carbon exposure and net zero commitments

In the longer term, the Trustee expects to:

- Regularly review the climate-related risks and opportunities in the Fund and maintain compliance with regulatory requirements, with support from the Fund's advisers.
- Ensure it is well equipped with sufficient knowledge and developments around climate change risk.
- Continually consider the suitability of the Fund's investment strategy to move to the agreed target reduction in carbon exposure.

DC Section

The key messages from this report are:

- Climate change risk can have an impact on the long-term outcomes for DC members. The Trustee has processes in place to identify, assess and mitigate climate change risk.
- Three emissions-based metrics have been chosen to monitor the progress against climate change risk (Carbon Footprint, Weighted Average Carbon Intensity and Absolute Emissions) in addition to this, two portfolio alignment- based metrics have also been included; Implied Temperature Rise and % of portfolio with Science Based Targets Initiative Targets. Also, one non-emissions based metric has been shown: Data Quality.
- A target to reduce carbon emissions associated with the Default Investment Option by at least 45% (from 2019 levels) by 2030 and fully (i.e. to net zero) by 2050, has been set and actions have been determined to move towards the agreed target. The WACI for the Default Investment Option has reduced by c.55%, from 167.2 to 74.7 tCO₂e/\$million sales (Scope 1 and 2 only) over the six year period to 31 December 2025.
- Climate change risks and opportunities will again be considered as part of the triennial investment strategy review for the DC Section of the Fund in 2026. The Trustee recognises a balance needs to be maintained between meeting the investment objectives and considering these risks and opportunities.
- At the June 2025 ISC meeting, the Trustee discussed its findings from the ESG Beliefs Survey conducted in March 2025. This assisted the Trustee in understanding the current range of beliefs and views on key ESG issues as well as identify gaps in their understanding and to ensure that their policies and wider strategy is aligned with their beliefs. The Trustee believes that sustainable investment decisions are aided through establishing a foundation of clearly articulated ESG beliefs.
- The ESG Policy Document, that sets out the Trustee's key ESG principles that has been established and the approach to considering climate risk and other ESG factors, is reviewed annually alongside the Fund's governing documentation; SIP, investment beliefs and Risk Register.

The Trustee will continue engagement and to work with investment managers in respect of the following;

- Review voting and engagement activity in respect of climate change, including 'climate-related engagements' as a criteria for investment managers to report on their most significant votes.
- Sharing information on the Fund's target and asking managers to confirm what steps they are putting in place to reduce their carbon exposure and net zero commitments

In the longer term, the Trustee expects to:

- Regularly review the climate-related risks and opportunities in the Fund and maintain compliance with regulatory requirements, with support from the Fund's advisers.
- Ensure it is well equipped with sufficient knowledge and developments around climate change risk.
- Continually consider the suitability of the Fund's investment strategy, focusing on the Default Investment Option, to move to the agreed target reduction in carbon emissions.
- Review the appropriateness of the Fund's climate target given this has already been achieved. While the Trustee expects to review the appropriateness of the target each year, this review was not completed during the year due to the ongoing discussion around long term strategy.

Appendix A

Scenario analysis

As at 31 December 2025 for the DB Section and 31 March 2024 for the DC Section

Modelling Assumptions

Mercer's UK Capital Market Assumptions (analysis is shown as at 31 December 2025):

	Rapid Transition			Delayed Transition			Limited Transition			Failed Transition		
Asset class	5 Years	20 Years	40 Years	5 Years	20 Years	40 Years	5 Years	20 Years	40 Years	5 Years	20 Years	40 Years
Fixed Interest Gilts	-0.5%	0.1%	-0.4%	-0.3%	0.2%	-0.2%	-0.2%	-0.1%	-0.1%	-0.3%	-0.1%	-0.1%

Cash	-0.3%	-0.4%	-3.2%	-0.3%	0.5%	-0.4%	0.2%	1.7%	4.2%	0.5%	1.4%	2.6%

Climate scenario modelling is complex, and the Trustee is aware of associated modelling limitations. In particular:

- The further into the future you go, the less reliable any quantitative modelling will be.

- There is a reasonable likelihood that physical impacts are grossly underestimated. Feedback loops or 'tipping points', like permafrost melting, are challenging to model particularly around the timing of such an event and the speed at which it could accelerate.
- Financial stability and insurance 'breakdown' is not modelled. A systemic failure may be caused by either an 'uninsurable' 4°C physical environment, or due to the scale of mitigation and adaptation required to avoid material warming of the planet.
- Most adaptation costs and social factors are not priced into the models. These include population health and climate-related migration.

Cumulative Return

Excluding interest rate and inflation hedging exposures

The two graphs on the left show the impact on nominal cumulative investment returns for each climate scenario. The bottom chart shows the impact relative to the baseline (i.e. the 'climate impact'):

Key points at different time frames

5 Years – Under the Rapid Transition scenario cumulative investment returns decrease by c.0.5% over the 5-year period to 2030.

20 Years – As long-term physical damages begin to be priced in, the Failed Transition becomes the most impactful scenario, resulting in a reduction in cumulative returns of c.7.0% by 2045.

40 Years – Over the long-term physical damages are the main driver and the Failed Transition causes a reduction in cumulative returns of c.11.7%.

DC Section: Strategic Asset Allocation

The chosen scenarios help the Trustee understand the resilience of the Fund's Default Investment Option to different potential warming pathways covering eventual temperature increases over different timeframes. While a lower warming pathway (sub-2°C scenario) is one which governments, businesses and society should aim for, there is a possibility that a failure to reduce greenhouse gas emissions quickly enough could set off irreversible feedback loops that significantly warms the planet (i.e. the Failed Transition scenario).

The Trustee notes that the modelling may understate the true level of risk and that uncertainty is likely to be greater for higher warming scenarios, in particular, due to the difficulty in being able to accurately predict the future. Please note, climate-related scenario analysis is an ever-evolving space and as such the scenarios modelled may be subject to review in future periods.

The table below shows the high-level asset allocation for the Roche Flexible Retirement Lifestyle Strategy, further details on the underlying strategic asset allocation modelled for each of the component funds is in the Appendix. We assume a starting asset value of £100 with no contributions, this allows for assessment of the climate impact upon investment returns only.

Asset Class	Years to retirement (%)																				
	20+	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Equity	100	96.0	92.1	88.3	84.6	80.9	77.3	73.8	70.3	66.9	63.6	60.0	60.0	55.0	50.0	45.0	40.0	35.0	30.0	25.0	20.0

Cash	0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	8.3	16.7	25.0

Annualised Returns

The graph below shows the impact on annualised returns in Absolute terms in the Growth/Mid-career phase of the default investment option (i.e. from 20 years to retirement).

Over the 5-year period, transition risk dominates. The Rapid Transition is the most impacted scenario. Under this scenario there is a significant shock to returns in year 2 followed by a partial recovery. Overall, annualised returns are reduced by 1.3% p.a. over the 5-year period (relative to baseline) in the Rapid Transition.

Over the long term (20 years), physical damages are the dominant driver, and the Failed Transition becomes the most impacted scenario. This causes a reduction in annualised return of around 2.1% p.a. (relative to baseline) over the 20-year period.

Roche Flexible Retirement Lifestyle Strategy - Growth/Mid-career (20 years to retirement)

The charts below represent the output of the Trustee's quantitative analysis of the Growth/Mid-career phase of the DC Section's popular arrangement, the Roche Flexible Retirement Lifestyle Strategy. The charts represent projections of an asset value of £100 from an analysis date of 31 December 2023 over a period of 20 years to retirement and ignore the impact of future contributions.

The projection allows for the glidepath followed by the Roche Flexible Retirement Lifestyle Strategy. The first chart on the left is a 'zoomed in' version of the chart on the right to allow a more detailed understanding of climate impacts over the first 5 years.

Asset Projection

*The projections assume £100 initial asset value, with the baseline following Mercer's capital market assumptions' return expectations.

Key points at different time frames (all values expressed relative to baseline)

5 Years – Over this time period, transition risk dominates. The Rapid Transition is the most impacted scenario. Under this scenario there is a shock to asset values of about 9.5% in year 2 followed by a recovery in the following year. Overall, projected asset values at the 5-year point are reduced by 6.0% in the Rapid Transition.

20 Years – As longer-term physical damages begin to be priced in, the Failed Transition becomes the most impacted scenario. Failed Transition reduces the asset value by 32.9%. Alongside this, from 12 years onwards, the Limited Transition tapers off from the baseline, consistent with the physical damages materialising in this scenario.

Annualised Returns

The graph below shows the impact on annualised returns in Absolute terms in the De-risking Phase (10 years to retirement). Over the 5-year period, there is a shock to returns under the Rapid Transition of about 6.0% p.a. in year 2. This is marginally less than the Growth/Mid-career phase. Overall, annualised returns are reduced by 1.3% p.a. over the 5-year period (relative to baseline) in the Rapid Transition.

Over the 10 years, transition risks are still the most significant and therefore the Rapid Transition is most impacted. This causes a reduction in annualised return of around 0.6% p.a. (relative to baseline) over the 10-year period. The impact of the Orderly Transition and Limited Transition is small on the basis that transition costs and impacts are largely priced in.

Roche Flexible Retirement Life Strategy – De-risking (10 years to retirement)

Asset Projection

Key points at different time frames (all values expressed relative to baseline)

5 Years – Over this time period, transition risk dominates. The Rapid Transition is the most impacted scenario. Overall, projected asset values at this time point are reduced by 6.0% in the Rapid Transition.

10 Years – Transition risks are still the most significant and therefore the Rapid Transition is most impacted. However, the Failed Transition is becoming more impactful and future Physical damages start to be priced in. Under the Rapid Transition asset values are reduced by 5.7%. Under the Failed Transition the asset value is reduced by 3.0%.

Impact Summary – Growth/Mid-career (20 years)

	Asset Value Absolute Impact (£)	Climate Impact Annualised Returns (% p.a.)
Rapid Transition		
Impact at 5 years	-£9	-1.3%
Impact at 20 years	-£5	-0.1%
Orderly Transition		
Impact at 5 years	-£1	-0.1%
Impact at 20 years	+£5	+0.1%
Limited Transition		

Impact at 5 years	-£1	-0.2%
Impact at 20 years	-£69	-0.8%
Failed Transition		
Impact at 5 years	-£3	-0.5%
Impact at 20 years	-£176	-2.1%

Impact Summary – De-risking (10 years)

	Asset Value Absolute Impact (£)	Climate Impact Annualised Returns (% p.a.)
Rapid Transition		
Impact at 5 years	-£9	-1.3%
Impact at 10 years	-£12	-0.6%
Orderly Transition		
Impact at 5 years	-£1	-0.1%
Impact at 10 years	-£2	-0.1%
Limited Transition		
Impact at 5 years	-£1	-0.1%
Impact at 10 years	-£3	-0.1%
Failed Transition		
Impact at 5 years	-£2	-0.4%
Impact at 10 years	-£6	-0.3%

The tables above set out the annualised return impact of the climate scenarios relative to the baseline.

Over 5 years, transition risk dominates and could decrease the asset value by £9 under the Rapid Transition scenario for both the Growth/Mid-career phase and De-risking phase.

- Over 10 years, physical impacts and, to a lesser extent, transition risks are evident. The asset value could decrease by £6 under a Failed Transition for the De-risking phase, indicating that physical risks are more dominant.
- Over 20 years, physical impacts and, to a lesser extent, transition risks are evident. The asset value could decrease by £176 under a Failed Transition for the Growth/Mid-career phase, indicating that physical risks are more dominant.

Highlights from the scenario analysis:

Our analysis illustrates that a Failed Transition is by far the worst in terms of long-term returns.

This supports the view that long term investors collectively trying to bring about an effective transition is aligned to their fiduciary duty to seek the best return within risk, liquidity and complexity restraints.

Sector divergence (impact on different sectors within developed global equities over a 20-year period)

Naturally, climate exposure varies by sector. This is illustrated in the chart below which shows the cumulative impact on different sectors within developed global equities over a 20-year time frame (the below charts are not specific to the Fund). Under the Failed Transition there is a positive return impact for coal & manufactured fuels, fossil-based utilities and oil & gas. Under the Orderly and Rapid Transitions there is a positive impact for renewable energy (nuclear, other and wind & solar) that is naturally expected to gain.

Climate stress testing

Investors, and therefore “the market”, look to predict future events / impacts and allow for them in asset prices. As particular events become more likely, market pricing will change before the events occur.

This means that longer-term impacts, including transition impacts and particularly physical damages, could impact portfolios earlier than they occur.

Our Rapid Transition includes a shock around 2026 pricing in (and initially overreacting to a degree) to transition costs. Our Failed Transition includes shocks towards the end of the 2020s and 2030s pricing in future damage. While the exact timing of such shocks is unknowable, considering such shocks is important to risk analysis.

Modelling Assumptions

- Analysis is shown as at 31 December 2023.
- The baseline assumptions are based on Mercer's Stochastic scenarios.

Climate scenario modelling is a complex process, and the Trustee is aware of the modelling limitations. In particular:

- The further into the future you go, the less reliable any quantitative modelling will be.
- Looking at average asset class returns over multi-decade timeframes lead to invariably small impacts. The results are potentially significantly underestimated.

There is a reasonable likelihood that physical impacts are grossly underestimated. Feedback loops or 'tipping points', like permafrost melting, are challenging to model particularly around the timing of such an event and the speed at which it could accelerate.

- Financial stability and insurance 'breakdown' is not modelled. A systemic failure may be caused by either an 'uninsurable' 4°C physical environment, or due to the scale of mitigation and adaption required to avoid material warming of the planet.
- Most adaptation costs and social factors are not priced into the models. These include population health and climate-related migration.

Mercer's UK Capital Market Assumptions:

Asset Class	31/12/2023		
	5 Years	10 years	20 Years
MSCI World Equity	8.6%	8.9%	9.6%

Modelling Assumptions – Narratives

	Failed transition	Limited Transition	Rapid transition	Orderly transition
Summary	The world fails to meet the Paris Agreement goals and global warming reaches 4.3°C above pre-industrial levels by 2100. Physical climate impacts cause large reductions in economic productivity and increasing impacts from extreme weather events.	Policymakers implement limited NDCs and fall short of meeting the Paris Agreement goals. Global warming can reach over 2.8°C over pre-industrial levels in 2100.	Sudden divestments in 2025 to align portfolios to the Paris Agreement goals have disruptive effects on financial markets with sudden repricing followed by stranded assets and a sentiment shock.	Political and social organizations act quickly and predictably to implement the recommendations of the Paris Agreement to limit global warming to below 2°C.
Temperature change	Expected increase of 4.3°C, with a high-likelihood range of an increase between 3.4°C and 5.6°C by 2100.	Expected increase of 2.8°C, with a high likelihood range of an increase between 2.1°C and 3.5°C by 2100.	Average temperature increase stabilises at 1.5°C around 2050.	This scenario includes additional economic damage consistent with 1.8°C of average temperature rise – peaking in 2070.
Cumulative emissions	c5,000 GtCO ₂ (2020-2100)	c.3,000 GtCO ₂ (2020-2100)	c400 GtCO ₂ (2020-2100)	The additional damage under this scenario could be associated with further human emissions or greater impacts from feedback loops and tipping points.
Key policy & tech assumptions	Existing policy regimes are continued with the same level of ambition.	Policies are implemented to encourage decarbonization but have limited scope (only active carbon price schemes that have pricing up to 2060 are included), particularly for large carbon emitters aside from Key economies, that do not reach their NDC targets.	A highly ambitious low-carbon policy and rapid technology transition. Higher carbon prices, larger investment in energy efficiency and faster phase out of coal-fired power generation	An ambitious set of policies are introduced, leading to improvements in energy efficiency and replacement of unabated fossil fuel-based technologies with lower-carbon alternatives.
Financial climate modelling	Physical risks are priced in two different periods: 2026-2030 (risks of first 40 years) and 2036-2040 (risks of 40-80 years).	Physical risks are priced in two different periods: 2026-2030 (risks of first 40 years) and 2036-2040 (risks of 40-80 years), slightly mitigated by the attempted action that translate into slight transition risks in the 2026-2030 period.	Pricing in of transition and physical risks of the coming 40 years occurs within one year in 2025. As a result of this aggressive market correction, a confidence shock to the financial system takes place in the same year.	Pricing in of transition and physical risks associated with 1.5°C up to 2050 takes place over the first 4 years. The additional damage, beyond 1.5°C, impacts asset performance on a year-by-year basis with no advance pricing in.
Physical risks considered	Physical risks are regionally differentiated, consider variation in expected temperature increase per region and increase dramatically with rising average global temperature. Physical risks are built up from: - Gradual physical impacts associated with rising temperature (agricultural, labour, and industrial productivity losses) - Economic impacts from climate-related extreme weather events Current modelling does not capture environmental tipping points or knock-on effects (e.g., migration and conflict).

Modelling Assumptions, Risk Identification and Model

This report complies with the requirements of the technical actuarial standard TAS 100 version 2.

Data

This Appendix covers the data used in the analysis presented in this report. This includes the asset allocation modelled including how it will develop over time.

Assumptions

The key assumptions used in carrying out the analysis shown in this report are assumptions for the returns on assets under the base case. The climate scenarios are defined by assumed impacts on asset returns; yield curves and inflation experience relative to the base case. In addition, page 12 summarises the narratives behind our scenarios.

Risk Identification

This analysis is focused specifically on climate risk. Other risks should be considered as part of a wider review which may include asset liability modelling. Our climate scenarios are not necessarily “extremes” and so should not be construed as illustrating the maximum risk exposure.

Model

More information on the model and the underlying scenarios is available at the following link Mercer Climate Scenarios. The key limitations of the model are:

Not all physical risks are captured and so physical damage could be understated. This includes positive feedback loops that could accelerate warming and systemic impacts of warming for example relating to migration and war.

We have only illustrated 4 scenarios, therefore there is a wide range of possible outcomes not covered.

Comparison with previous projects

The Fund previously carried out the analysis contained in this report in 2023, since then the fundamental conclusions around the financial need to transition, the importance of sector allocation and the potential benefit of sustainable tilts in controlling transition risks have remained consistent.

Fund Benchmarks

Appendix B – Technical Appendix

Roles of those undertaking scheme governance activities

Investment Adviser to the DB Section (Mercer):

Mercer as the Investment Adviser and discretionary investment manager for the DB Section acts on behalf of the Trustee, to seek to manage the risks and opportunities associated with ESG considerations by selecting industry leaders in investment management in accordance with its Sustainable Investment Policy and against criteria which include ESG considerations. Mercer provides advice to the Investment Sub-Committee and Trustee on the investment strategy and investment manager appointments (where relevant) and acts to make changes to the portfolio under the agreed delegated authority. This includes managing and monitoring investment-related risks, such as climate change, from a strategic asset allocation perspective and with the appointed sub-investment managers.

Investment Adviser to the DC Section (Mercer):

Mercer provides advice to the ISC and Trustee on the investment strategy and investment manager appointments. This includes advice on managing and monitoring investment-related risks, such as ESG factors, stewardship and climate from a strategic asset allocation perspective and with the appointed investment managers. The Investment Adviser provides climate-related scenario analysis, advice and training on the selection of climate-related metrics for the Fund to monitor. The Investment Adviser will assist the Trustee in producing the Fund's climate change-related disclosures report on an annual basis. The Trustee works with its DC Section advisers (Investment Adviser, Mercer and Governance Adviser, Aon) to ensure that climate-related risks and opportunities are considered as part of their risk management framework.

Mercer collects data in relation to the Fund's climate metrics annually, assists the Trustee in reviewing the appropriateness of the Fund's current targets and provides progress against these targets. The latter being provided as part of Mercer assisting the Trustee in producing the Fund's climate change-related disclosures report on an annual basis.

Mercer also looks at stewardship on behalf of the Trustee, covered as part of the Trustee's annual Implementation Statement, and the Fund's ESG Policy.

Scheme Actuary (Willis Towers Watson):

The Scheme Actuary of the DB Section advises on the funding position, including an understanding of the potential funding impact of changes to financial or demographic assumptions driven by climate change; and works with the Fund's other advisers to assist the Trustee in incorporating climate change in its investment and covenant monitoring, and communication with stakeholders as appropriate.

Covenant Adviser (Grant Thornton):

Grant Thornton as the Fund's Covenant Adviser for the DB Section supports the Trustee in a proportionate way to understand as part of its covenant monitoring framework, how climate-related risks and opportunities might affect the Fund's sponsoring employer over the short, medium and long term;

and works with the Trustee's other advisers, if and when requested, to assist the Trustee in incorporating climate change in its governance arrangements and monitoring framework as appropriate.

In-house support:

The Reward Team provides support to the Trustee as well as acting as liaison between the Trustee and the Company. Their primary role is to provide challenge to recommendations to ensure advice provided to the Trustee will facilitate effective decision-making.

Metrics

Limitations

The decarbonisation analysis focuses on listed equity and corporate bond portfolios. Emissions metrics and decarbonisation targets used in this report are in respect of all greenhouse gases covered by the Kyoto Protocol and are expressed in terms of carbon dioxide equivalents (CO₂e) – the amount of CO₂ which would have the equivalent global warming impact. While different greenhouse gases are expected to have different net-zero dates under a 1.5°C aligned outcome, CO₂ pathways target a 2050 net-zero end point and this end point has been adopted in this instance.

Caution should be exercised in interpreting individual data points, as in reality, emissions may differ, given the data coverage in the analysis is less than 100%. Where companies do not have data points, companies are assumed to have the same carbon metrics as the average of companies that we do have data points for. This means that, where we do not have data, we are not assuming that those companies have zero emissions.

The focus of the decarbonisation curves is currently on Scope 1 and Scope 2 emissions. Mercer will seek to integrate Scope 3 emissions as methodologies improve. Decarbonisation progress is shown using the carbon footprint metric set out in this report. A fuller picture of progress can be provided by tracking progress against further metrics, such as on an absolute emission and WACI basis, given limitations associated with relying on a single climate metric.

Many of the IPCC's scenarios are reliant on net-zero (or net-negative) assumptions later this century. This can include the deployment of mitigation technologies, such as carbon capture and storage, as well as ecosystem approaches, such as land and forest conservation and restoration. There has been some skepticism as to whether such technologies and approaches are viable, at the required scale. Mercer will look to integrate further assumptions around net-zero emissions in due course, as the science and technology evolves.

Scope 3 emissions for listed equities and corporate bonds are calculated using estimated data due to the lack of availability or poor quality of reported data. Even when reported data is available for scope 3 emissions, there is no guarantee of consistency between the reported figures across different companies, as companies often only report on a subset of the 15 categories of scope 3 emissions. MSCI estimates emissions across each of the 15 categories using a combination of revenue estimates and production data. Using MSCI estimated scope 3 data only ensures that data is consistent for all companies across similar sectors, providing a more robust understanding of where the risks lie and a better intertemporal understanding of how portfolios have evolved.

Sovereign bonds emissions

The Greenhouse Gas Protocol's definition of Scope 1, 2 and 3 emissions was initially developed for classification of corporate emissions, rather than sovereigns. In this report, we have adopted the recommendations of the Partnership for Carbon Accounting Financials (PCAF) when reporting sovereign emissions. PCAF's scope definition for sovereign debt is as follows:

Scope 1	Scope 2	Scope 3
Domestic GHG emissions from sources located within the country territory.	GHG emissions attributable to the import of electricity, steam, heat and cooling from outside the country territory.	GHG emissions attributable to all other (non-energy) imports from goods or services from outside the country territory.

These scopes have been further mapped to the following emissions metrics which are presented in this report:

- Production emissions = Scope 1
- Consumption emissions = Scope 1 + Scope 2 + Scope 3 – Exported emissions*

The definition of Production emissions follows the territorial emissions approach adopted by the United Nations Framework Convention on Climate Change (UNFCCC) for annual national inventories. Production emissions are presented including land use, land-use change and forestry (LULUCF) emissions.

- Absolute emissions for sovereign debt have been calculated as follows (for both Production and Consumption emissions):
 - $$\text{Absolute emissions} = \frac{\text{Market value of exposure to sovereign bond (USD)}}{\text{PPP-adjusted GDP (USD)**}} \times \text{Sovereign emissions (tCO}_2\text{e)}$$

Used for both Production and Consumption sovereign intensity for internal consistency with absolute emissions calculations.

- Sovereign intensity metrics have been calculated as follows:
 - $$\text{Sovereign intensity} = \frac{\text{Sovereign emissions (tCO}_2\text{e)}}{\text{PPP-adjusted GDP (USD)**}}$$
 - $$\text{Sovereign consumption intensity} = \frac{\text{Consumption emissions}}{\text{Capita}}$$

Used for Consumption emissions only, in line with PCAF recommendations.

* Equivalent to Consumption emissions = Production emissions – Exported emissions + Imported emissions;

** Purchase Power Parity-adjusted Gross Domestic Product.

ITR is quoted in degrees centigrade, and is designed to highlight how consistent a company's business model (both now and through their projected emissions reduction targets) is with limiting warming this century to 1.5°C. At a high level, the metric is calculated as follows:

1. **Calculating a company-specific carbon budget** in metric tons of CO₂e that the company can emit to be aligned with a pathway for limiting global warming to 1.5°C.
2. **Projecting the company's future emissions** through 2050 based on current emissions and reported emissions-reduction targets. A company projected to emit carbon below budget can be said to “undershoot” the budget; a company projected to exceed the budget “overshoots” it.
3. **Converting the company's relative carbon budget over- or undershoot** to an ITR, expressed in degrees Celsius.

MSCI calculates ITR as follows:

$$ITR = \text{Base Temp} + \frac{\text{Absolute Over/Undershoot}_i}{\text{Carbon Budget}_i} \times \text{Global Budget} \times \text{TCRE}$$

Where:

- *ITR*: Implied Temperature Rise in °C
- *Base Temp*: Reference temperature for the benchmark scenario (1.55°C as per NGFS Net Zero 2050)

- *Absolute Over/Undershoot*: Cumulative over- or undershoot of company i. *Carbon Budget*: Remaining 1.5°C-aligned carbon budget of company
- *Global Budget*: Remaining global carbon budget for the 1.5°C pathway in GtCO_{2e}
- *TCRE*: Transient Climate Response to cumulative CO₂ Emissions (0.00045 or 0.45°C per 1,000 GtCO₂)

The TCRE was established by the IPCC and provides a relationship that links each additional unit of emissions emitted beyond the available remaining global 1.5°C carbon budget to degrees of additional warming. MSCI uses a TCRE factor equal to 0.00045 or 0.45°C per 1,000 GtCO₂. This means that each 1,000 GtCO₂ of cumulative emissions is expected to lead to, an additional ~0.45°C warming.

This report sets out various metrics related to the greenhouse gas (“GHG”) emissions attributable to the Fund’s mandates. The metrics contained in this report are calculated using MSCI, with portfolio stocklists sourced directly from the investment managers.

Listed assets (equities and corporate bonds)/ Non-sovereign assets		
Emissions metrics	Metric expressed as	Description
Weighted Average Carbon Intensity (WACI)	tCO _{2e} / \$million sales	Average exposure (weighted by portfolio allocation) to GHG emissions normalised by sales. It seeks to answer how carbon intensive the companies in the portfolio are.
Carbon Footprint	tCO _{2e} / \$million invested	Total GHG emissions figure normalised to take account of the size of the investment made. It seeks to answer how carbon intensive parts of the portfolio are.
Absolute Emissions	Total GHG emissions: metric tons of CO ₂ and equivalents (tCO _{2e})	Calculates an investor’s share of the total emissions for each company/holding. It seeks to answer what emissions the investor is responsible for.
Alignment metrics	Metric expressed as	Description
Implied Temperature Rise (ITR)	Expressed as °C	Prediction of temperature rise scenario over the rest of the century, given a company’s emissions, commitments, and momentum. Shows how companies/portfolios compare to the 1.5°C Paris agreement temperature rise goal.
SBTi	Percentage of portfolio with SBTi targets	A measure of how many companies in a portfolio have submitted climate transition plans that have been approved by the Science Based Targets Initiative (SBTi) – for DC Section only
Non-emissions metrics	Metric expressed as	Description
Data Quality	Percentage of portfolio, which is either verified, reported, estimated or unavailable	Classifies each mandate’s company/holding data as one of the following four categories: Verified, Reported, Estimated, and Unavailable. Additional categories account for the remainder of the portfolio that is not included in the data quality analysis due to being cash or derivatives.
Climate Value at Risk (cVaR)	Expressed as £m	Measures the size of the financial loss attributable to climate-related risks a portfolio may experience, within a given time horizon, if a particular scenario unfolds - for DB Section only

Sovereign bonds		
Emissions metrics	Metric expressed as	Description
Sovereign Carbon Intensity	tCO2e/\$million PPP-Adjusted GDP	A measure of how carbon intensive the sovereign countries held in the portfolio are. Sovereign emissions are normalized by PPP-adjusted GDP to take into account the size of the country's economy. This is equivalent to the listed assets Carbon Footprint metric.
Absolute Emissions	Total GHG emissions: metric tons of CO2 and equivalents (tCO2e)	A measure of how much emissions the investor is responsible for. It is calculated as an investor's share of the total emissions for each sovereign.
Sovereign emissions data shown are consistent with the PCAF definition of sovereign emissions. Data sourced from MSCI.		

Metric category	Selected metric	Further detail
Absolute emissions	Total Greenhouse Gas Emissions	Tonnes of carbon dioxide and equivalents (tCO2e) that the Fund is responsible for financing.
	Carbon Footprint	The amount of carbon dioxide and equivalents (tCO2e) emitted per million dollars of the Fund's investments.
Emissions intensity	Weighted Average Carbon Intensity (WACI)	The exposure of the Fund to carbon-intensive companies, measuring the amount of carbon dioxide and equivalents (tCO2e) emitted per million dollars of holding company / issuer revenue ² on average.
	% of portfolio companies with targets approved by the Science Based Targets initiative (SBTi)	Assessment of the proportion of portfolio companies/issuers that have set net-zero targets that have been validated by SBTi. This is just used for the DC Section.
Portfolio Alignment	Implied Temperature Rise (ITR)	A forward-looking assessment of how aligned the Fund's portfolios are relative to the Paris Agreement's 1.5°C target. This is estimated based on the activities and decarbonisation targets of portfolio companies / issuers, relative to what global decarbonisation needs to be to achieve 1.5°C.
Additional	Data Quality	Represents the proportions of the portfolio for which the Trustee has high quality data.
	Climate Value at Risk (cVaR)	Measures the size of the financial loss attributable to climate-related risks a portfolio may experience, within a given time horizon, if a particular scenario unfolds. This is just used for the DB Section.

² For sovereign bonds, Greenhouse Gas Emissions are expressed relative to Purchasing Power Parity adjusted Gross Domestic Product (PPP-adjusted GDP), for both Production and Consumption sovereign intensity for consistency with absolute emissions calculations. For sovereign consumption intensity emissions, Greenhouse Gas Emissions are also expressed on a per capita basis, in line with the Partnership for Carbon accounting of Financials guidance.

Climate Change Glossary

C

Carbon footprint

The amount of carbon dioxide released into the atmosphere as a result of the activities of a particular individual, organization or community. Carbon footprint is calculated for each company as (Scope 1 and 2 carbon emissions / \$m investments). See also Scope 1, 2, 3 emissions and Weighted average carbon intensity (WACI).

Carbon intensity

The amount of emissions of carbon dioxide (or other greenhouse gasses) released per unit of another variable such as revenue, gross domestic product (GDP), per \$1million invested etc. See also Weighted Average Carbon Intensity (WACI).

Carbon price

The price for avoided or released carbon dioxide (CO₂) or CO₂-equivalent emissions. This may refer to the rate of a carbon tax, or the price of emission permits. In many models that are used to assess the economic costs of mitigation, carbon prices are used as a proxy to represent the level of effort in mitigation policies.

Carbon neutrality

Achieved by offsetting emissions by paying for credits (usually certified via new forestry equivalents that provide carbon removal). Carbon neutrality is similar to net zero targeting – the latter requires actual emissions reductions to meet targets though (rather than purchasing offsets). See also Net zero CO₂ emissions.

D

Decarbonisation

The process by which countries, individuals or other entities aim to achieve zero fossil carbon existence. Typically refers to a reduction of the carbon emissions associated with electricity, industry and transport.

G

Global warming

The estimated increase in global mean surface temperature expressed relative to pre-industrial levels unless otherwise specified. See also Pre-industrial.

Greenhouse gases

Gases in our planet's atmosphere which trap heat. They let sunlight pass through the atmosphere but prevent heat from leaving the atmosphere. Greenhouse gases include: Carbon Dioxide (CO₂), Methane (CH₄), Nitrous Oxide (N₂O), Hydrofluorocarbons (HFCs), Perfluorocarbons (PFCs), Sulphur Hexafluoride (SF₆), Nitrogen Trifluoride (NF₃).

I

Inevitable policy response

A scenario that expects an acceleration of climate-related policy announcements in 2023–2025, which has been supported by the Principles for Responsible Investment (PRI).

M

Mitigation (of climate change)

A human intervention to reduce emissions or enhance the sinks of greenhouse gases.

Mitigation strategies

In climate policy, mitigation strategies are technologies, processes or practices that contribute to mitigation, for example, renewable energy (RE) technologies, waste minimization processes and public transport commuting practices.

N

Net zero CO₂ emissions

Net zero carbon dioxide (CO₂) emissions are achieved when CO₂ emissions are balanced globally by CO₂ removals over a specified period. The term “net zero” is also typically associated with the 2050 date or earlier, as this is aligned with the scientific recommendations to achieve a 1.5°C scenario. See also Carbon neutrality (which differs slightly).

Climate Change Glossary

P

Paris Agreement

The Paris Agreement under the United Nations Framework Convention on Climate Change (UNFCCC) was adopted on December 2015 in Paris, at the 21st session of the Conference of the Parties (COP) to the UNFCCC.

The agreement, adopted by 196 Parties to the UNFCCC, entered into force on 4 November 2016 and as of May 2018 had 195 Signatories and was ratified by 177 Parties.

Physical risks

Dangers or perils related to the physical or natural environment that pose a threat to physical assets e.g. buildings, equipment and people. Mercer's scenario analysis grouped these into the impact of natural catastrophes (for instance sea level rise, flooding, wildfires, and hurricanes) and resource availability (particularly water). See also Transition risks.

Pre-industrial

The multi-century period prior to the onset of large-scale industrial activity around 1750. The reference period 1850–1900 is used to approximate pre-industrial global mean surface temperature (GMST).

Principles for Responsible Investment (PRI)

Non-profit organisation which encourages investors to use responsible investment to enhance returns and better manage risks. It engages with global policymakers and is supported by, not but part of the United Nations. It has six Principles for Responsible Investment that offer a menu of possible actions for incorporating ESG

R

Resilience

The capacity of social, economic and environmental systems to cope with a hazardous event or trend or disturbance, responding or reorganising in ways that maintain their essential function, identity and structure while also maintaining the capacity for adaptation, learning and transformation.

S

Scope 1, 2, 3 emissions

Scope 1 emissions are direct emissions from owned or controlled sources. Scope 2 emissions are indirect emissions from the generation of purchased energy. Scope 3 emissions are all indirect emissions (not included in scope 2) that occur in the value chain of the reporting company, including both upstream and downstream emissions.

Stranded assets

Assets exposed to devaluations or conversion to "liabilities" because of unanticipated changes in their initially expected revenues due to innovations and/or evolutions of the business context, including changes in public regulations at the domestic and international levels.

Sovereign carbon intensity

Measurement of carbon emissions per unit of economic output (e.g. GDP). It provides an insight into how efficiently a country is utilising carbon-based energy sources and the level of carbon emissions associated with its economic activities

T

Transition

The process of changing from one state or condition to another in a given period of time. Transition can be in individuals, firms, cities, regions and nations, and can be based on incremental or transformative change.

Transition risks

Risks from policy changes, reputational impacts and shifts in market preferences, norms and technology. See also Physical risks.

W

Weighted average carbon intensity (WACI)

The carbon intensity of a portfolio, weighted by the proportion of each constituent in the portfolio. Carbon intensity is calculated for each company as (Scope 1 and 2 carbon emissions / \$m sales). See also Carbon footprint.
